The new W&H image campaign: ‘From a patient to a fan’

By W&H

You could describe them as every- day heroes of dentistry and dental professionals who, through their dedication, professional skill or simply a friendly smile, manage to transform a dental appointment into a positive event. They do this simply because they care and want to make sure their patients feel comfortable. It is precisely this aspect that will be the focus of W&H’s new image campaign ‘From a patient to a fan’, which will shine a spotlight not on the company itself, but on dentists and their teams. We interviewed Anita Thallinger, W&H Marketing Director, about the background, objectives and challenges of this new advertising campaign.

In February 2018, the new W&H image campaign will be launched on the global dental market. What objectives did you set for yourself for the new campaign?

Anita Thallinger: One of our objectives was, of course, to draw the attention of the world of dentistry to W&H, and to make ourselves stand out from the competition in the long term by way of the new image campaign. But we also want to show dentists and their practice teams that W&H is there for them as a solutions provider and does its utmost to support them in overcoming their day-to-day challenges.

As mentioned in the introduction, W&H’s new image campaign ‘From a patient to a fan’ will not be focused on the company itself, but on dentists and their teams. Why did you opt for this approach in your campaign?

W&H serve our customers, i.e. dentists and their practice teams, to know that W&H values their work, their dedication and their skills. As a manufacturer of innovative dental solutions, it is our aim to provide us- ers with products that bring added value when used. As the practice team need to give patients their undivided attention throughout the entire treatment process, W&H sees that its primary task as optimising and facilitating the workflow. Our innovative products are not only high in quality, they are also intuitive, reliable and above all precise in their functioning. Our intention is to support dentists and their teams and offer them products that meet these requirements.

This campaign features smiling dentists and patients, happy faces. What makes your current campaign different from that of your competitors?

Anita Thallinger: It’s true, compared to the previous campaign, the new image campaign seems at first glance to be going down a very traditional route. However, W&H is known for its slightly tongue-in- cheek advertisements. You’ll notice this in the current campaign if you take a closer look at the name tags of the dentists pictured.

If someone is exceptionally good at something, or becomes synonymous with something, they become

Children with tooth ache see pharmacist or emergency doctor rather than dentist

By DTI

LONDON, UK: In England, dentists are often not the first person to see a child suffering from pain or toothache, a survey published in The BMJ has confirmed. Instead, the majority of parents in the country heavily rely on pharmacies and non-dental health services, like accident and emergency departments, to address their children’s emergency dental problems.

Conducted by researchers at the Institute of Dentistry at Queen Mary University of London, the study looked at data collected from over 900 pharmacies in and around London from November 2016 to January 2017. According to the results, two-thirds of parents had requested pain medications for their children owing to dental problems. Of those, only every third child with oral pain had seen a dentist before visiting the pharmacy, while almost every third had presented to a non-dental health professional, such as a general medical practitioner.

Although many parents had sought help during weekends, when dental health services were not available, the figures show a clear underuse of dental services in the country, the researchers explained. They said that the annual costs for the use of non-dental services, amounting to £373,288, which translates to £2.3 million of preventable costs for the NHS, when replicated to all pharmacies in the UK.

“These children had not only failed to see a dentist before their pain visit, they had seen a GP and a range of other health professionals outside dentistry. This inappropriate and overdue of multiple health services including A & E is costing the NHS a substantial amount of money at a time when reducing waste is a government priority,” she added.

According to 2016 statistics, only 38 per cent of children in England and 49 per cent of children in London had visited a dentist that year, even though dental care is free for under-12s and many other children. The guidelines recommend dental visits at least every year for children.

The study, titled “Children’s toothache is becoming more of a business: Where do parents go when their children have oral pain in London, England: A cross-sectional analysis”, was published in BMJ Open on 28 February 2018.
