From digital planning to the mock-up and final restoration

Presentation of a modern work concept on the basis of a veneer fabrication

By Dr Cyril Gaillard and Dr Jérôme Bellamy, France

The demand for cosmetic treatments is also increasing in dental practices. Today’s communication media provide patients with virtually limitless access to a wealth of information on this topic. And with it comes an increase in expectations. This can pose a conundrum to the dentist: patients want to be promised the desired results yet they should not be given undue expectations in the run-up to the treatment.

The challenge
One of the challenges in day-to-day dentistry is the fact that the mock-up presented to the patient is produced from a wax-up and is often not consistent with the final outcome of the treatment (e.g. ceramic veneers). Several research studies have been initiated to overcome this problem. The SKYN concept is a result of this research.

The solution
The SKYN concept is based on a unique approach: it uses natural tooth shapes to create a mock-up directly in the patient’s mouth. A wax-up is created on the basis of tooth shapes that reflect the anatomy and morphology of natural teeth in terms of height, width, curvature and surface texture.

The predictability of the result is ensured by using CAD/CAM technology to scan the mock-up, make adjustments in the oral cavity and then mill the veneers to achieve life-like results.

The reproducibility of the mock-up and the accuracy of the result arise, among others, from the performance of the furthermore, the restorations present an accurate copy of the esthetic wax-up. The different working steps involved in the SKYN concept are demonstrated below on the basis of a clinical case.

Clinical case
Preoperative situation
The patient visited the practice with a request that mainly concerned esthetic criteria. She felt that her anterior restorations looked too yellowish and their shape did not fit in. The periodontal apparatus was healthy. The soft tissues did not show any signs of abnormalities either.

Treatment planning
We recommended the patient to have the anterior region restored with veneers stretching from teeth 15 to 23 and advised her to have the premolars included in the restoration to achieve a harmonious appearance. The patient agreed with our proposal. We drew up the following treatment plan:

- Wax-up using composite veneers to reproduce the natural shape and texture of the teeth
- Mock-up according to the SKYN concept using a light-curing nanohybrid composite (IPS Empress® Direct)
- Intraoral digital data scan of the mock-up
- Preparation of the teeth with the help of the mock-up
- Digital impression of the preparation using an optical camera
- Fabrication of the temporaries
- Machining of the glass ceramic composite veneers

Fabricating the wax-up
The aim of the ceramic veneers was to give more volume to the teeth. The teeth should appear stronger and longer. Adjusting the proportions was requisite to creating a harmonious appearance between the teeth and the smile on the patient’s face. To create the wax-up, we used the SKYN models (“Anterior Model Set” by Dr Jan Hajtó) as reference (Fig. 2). This is a reproduction of natural teeth. Upon request by the patient, tooth selection was performed with the help of both the DSD program (Digital Smile Design) and the Visagis® Male design and visualization software.

Transfer to the mock-up
We created a silicone key of the vestibular surfaces with the help of the wax-up and applied a thin layer of composite material into the key using a spatula (IPS Empress Direct) (Fig. 3). Once light cured (Bluephase® with Polywave® LED), the resulting composite veneers for teeth 15 to 23 were placed on the model and stabilized with wax (Fig. 4). Once the wax-up was finalized, it was duplicated and cast in stone. We created a silicone key from this model to assist the dentist in the preparation of the teeth. The silicone key was created in two steps using two different silicate materials, one with a high hardness (Silico Dur, Cendres+Métaux) and the other with a low hardness (3M ESPE Express). The silicone key served to create the mock-up and the temporaries.

Tooth preparation and data transfer to the lab
The mock-up was inserted with the help of the silicone key and the surface texture was reworked using a polishing system (Astropol®) (Fig. 5). The esthetic effect was validated with photographs and videos. The patient could also inspect the pictures (Figs 6 and 7).

Then, the teeth were prepared using a ball-shaped bur whilst the mock-up was in place (Galip Gurel 2003) (Fig. 8). This procedure meets the requirements of minimally invasive dentistry. An impression of the prepared teeth (Fig. 9) was taken using an intraoral scanner and the temporaries were fabricated with the help of the silicone key. At this point, the dentist is required to take two optical impressions: first, an impression of the prepared teeth and, second, an impression of the temporaries in the mouth. In addition, a conventional silicone impression of the prepared teeth is taken. The dental technician will use this impression to produce a physical model to check the fit and contact points of the milled ceramic veneers.

“Never promise what you can’t deliver!”
Particularly when undergoing esthetically motivated dental treatment, patients should be given a realistic visualization of the final outcome to avoid raising undue expectations.

CAD/CAM technologies have brought about a revolution in dentistry. They enable the efficient manufacture of customized ceramic veneers with high accuracy and within a short period of time.

Fig. 1a and 1b: Preoperative situation. Severely stained restorations in the upper anterior region. It does not bother the patient that her upper lip is asymmetrical and her gum line is visible when she laughs.

Fig. 2: SKYN models (according to Dr Jan Hajtó) for the fabrication of the wax-up.

Craft the **Perfect Smile Today!**

**Cosmetic Enamel Rejuvé Kit**

for Smile Rejuvenation & all Cosmetic enhancements

**DESIGNED FOR:**
- Creating new smiles,
- Revival of aged smiles,
- Brightening dull smiles,
- Correcting less than perfect smiles,
- Enhancing existing smiles

For more information, simply contact your nearest Shofu Dealer Today!
Creating the final restoration

For the CAD construction, the two data sets (temporaries, prepared teeth) were superimposed in the software (Fig. 10). Subsequently, the shape of the temporaries was matched to the preparation margins. Each component was examined (preparation margin, thickness, contact points, etc.) separately before the data was transmitted to the milling unit for machining (Fig. 11). For the fabrication of the veneers, we decided to use the IPS Empress CAD Multi blocks, which feature a lifelike shade transition from the dentin to the incisal. Each veneer was positioned in the block in such a way that the transparence of the incisal area matched our requirement. Once the veneers were milled, we checked their fit on the prepared dies of the model and assessed their contact points with each other. The surface texture was lightly reworked (Fig. 12). To achieve a highly esthetic result, we additionally characterized the veneers with stains and essence materials (IPS Ivocolor®) before we glaze-fired them (Fig. 11).

Seating the ceramic veneers

At the try-in, the shade and fit were checked. All ten veneers showed an excellent fit in the mouth. The next step was adhesive bonding. Prior to the bonding procedure, a rubber dam was placed to isolate the treatment field and keep it dry. As the natural teeth were not discoloured, we were able to use a translucent luting composite (VarioLux® Esthetic) to insert the veneers (Fig. 13).

The veneers were seated using the following protocol:

- The restorations were etched with hydrofluoric acid for 60 seconds, rinsed under running water and dried with compressed air.
- The prepared teeth were etched with 37% phosphoric acid gel (Total Etch) and rinsed.
- Fluoride-releasing Excite® F DSC adhesive was applied (without light-curing).
- The veneers, which were coated with luting composite, were seated.
- The luting composite was tack-cured for 1 to 2 seconds (Bluephase with Polywave LED) to facilitate the clean-up of excess luting composite.
- Final light curing of all veneers for 40 seconds.
- Removal of the rubber dam and occlusal check. At the last step, the restorations were polished.

The ceramic restorations show an appealing esthetic appearance in the mouth and harmonize beautifully with the smile of the young patient. The planned situation was accurately transferred to the final restoration (Figs 14 to 16).

Conclusion

Modern materials in esthetic dentistry allow pleasing results to be achieved with considerably more ease than before. It may be consid- ered a substantial progress that the resulting restorations meet not only high esthetic requirements but also essential functional criteria. State-of-the-art planning tools, digital auxilia- ries, CAD/CAM-supported manufactur- ing and promising materials lead to excellent results and ensure high patient satisfaction. However, never mind the CAD/CAM technologies, the skills and experience of a sea- soned dental technician will remain indispensable.

Certificate & Diploma in Clinical Endodontics

From British Academy of Restorative Dentistry

DUBAI 2018-2019

Diploma | 3 Modules | 12 Days
Module 1 | November 2018 (4 days) | Dental Resorption and Pattern of Tooth Fracture
Programme outline: Understanding advanced endodontic problems.
Hands-on: Reciprocating NiTi and Carrier based thermoplastic obturation techniques.

Module 2 | February 2019 (4 days) | Restoration of Endodontically Treated Teeth
Hands-on: Placement of core restorations and post retained restorations.

Module 6 | May 2019 (4 days) | Management of Endodontic Failure
Programme outline: Endodontic retreatment, surgical endodontics.
