Americans support dental coverage in health care reforms

Over 60 per cent of Americans consider dental coverage part of an overall health care reform by the Obama legislation, a new public opinion survey has shown. The poll released at the launch of National Smile Month in June and commissioned by Oral Health America revealed that four in five adults agree that dental benefits are as important as general medical benefits in an overall health care benefit package.

Many poor and lower-middle class families in the US currently do not receive enough dental care, in part because dentists prefer patients who have private insurance or can pay in cash. The lack of dental care is also not restricted to the poor, recent data shows. Experts on oral health say that about 100 million Americans have no access to adequate care.

In a recent letter to US president Barack Obama, the American Dental Association (ADA), which represents over 157,000 dentists in the US, recently urged the government to pay more attention to dental health care in the ongoing health-policy debate. “Acknowledging that the majority of Americans have access to excellent and relatively affordable dental care [...], we are compelled to point out that too many low-income Americans still suffer needlessly from dental disease,” the letter states. “More must be done to ensure that all Americans have access to quality oral-health services.”

The ADA recommends increasing funding to the nationwide Medicaid health programme, rebuilding the public dental-health infrastructure and supporting community-based prevention measures, such as fluoridation or school-based education programmes.

Obama’s health care reform initiative aims to extend health coverage to 45 million uninsured people in the US, as well as to preserve consumer choice and lower rising health care costs, by cutting more than US$200 billion in reimbursements to hospitals over the next decade. He has also announced his support of the introduction of a public health insurance plan, a concept similar to the failed health care plan developed by his current Secretary of State and former First Lady Hillary Clinton back in 1994.

The government’s health-care reform proposals are opposed by the US Congress and other organisations like the American Medical Association, who say that the realisation would cost a total of US$1 trillion over the next decade and still leave millions of people in the US uninsured.

The best of two worlds. Identium®

Utilizing the best characteristics of two well-known impression materials, Kettenbach has developed an entirely new one: Vinylsiloxanether®. Designed especially for the one-step impression technique: Identium®.

FDI pushes caries initiative with Rio conference

Daniel Zimmermann

In order to address the global burden of dental caries, the FDI World Dental Federation has announced its first Global Caries Initiative Conference, which is to be held in July in Rio de Janeiro in Brazil. The event, organised in collaboration with the International Association for Dental Research and the Brazilian Dental Association, will mark the start of the organisation’s ten-year campaign to eliminate tooth decay by the year 2020, officials said.

According to the FDI, caries remains the most common dental disease worldwide. Although there has been a decline of dental decay in industrialised countries in recent years through fluoridated toothpaste and improved dental hygiene, in most low-income countries, up to 90 per cent of all people suffer from the condition, which often remains untreated.

The Rio conference is intended to address these inequalities amongst other topics. It will be for dental educators and scientists, as well as presidents of dental associations and government dental officers. Speakers from North America and Europe have been invited to address the need for changing the current paradigm of diagnosis, prevention and restoration of dental caries, and to present the implications of these for its future prevention and management.

Swine flu could spread through teeth

Penny Palmer

LONDON, UK: Bad dental hygiene could increase the risk of swine flu, according to the British Dental Health Foundation. The organisation’s recent National Dental Survey has found that dreadful dental habits are helping spread germs, as 40 per cent of the UK population admit to picking their teeth with their fingernails. It has also revealed that people pick their teeth with everyday items such as earrings, credit cards, paper clips, paper and even screwdrivers.

Foundation Chief Executive Dr Nigel Carter said: “Hygiene warnings have been made clear ever since the swine flu outbreak, and it is worrying that these habits have been revealed as the numbers affected clear ever since the swine flu outbreak, and it is worrying that these habits have been revealed as the numbers affected.”

The Department of Health (DH) in the UK recently issued guidance to dental practices on procedures that should be observed by dental practices for treatment during a pandemic, as illness and fear of infection will encourage patients to avoid attendance. The DH warned dentists, it is likely that fewer patients are likely to seek treatment during a pandemic.

All patients should be screened by telephone for symptoms of flu before attending the practice and again on arrival, said the DH. Treatment of infected patients should be segregated from healthy patients. Personal hygiene should be a top priority for all.”

Facts

- Internal tri-channel connection for accurate and secure prosthetic restorations
- TiUnite® surface and Groovy™ to enhance osseointegration
- Implant design that replicates the shape of natural tooth roots
- Color-coded system for accurate and fast component identification and ease of use
- Color-coding: step-by-step drilling protocol for predictable surgical procedures
- 10 YEARS WITH TIUNITE® SURFACE
- New data confirm long-term stability.

 versaibility, ease-of-use and predictability have made NobelReplace Tapered the most widely used implant design in the world.* NobelReplace Tapered is a general use, two-piece implant system that performs both in soft and hard bone, one- and two-stage surgical procedures, while consistently delivering optimal initial stability. NobelReplace Tapered is a system that grows to meet the surgical and restorative needs of clinicians and their patients – from single-tooth restorations to more advanced multi-unit solutions. Whether clinicians are just starting or are experienced implant users, they will benefit from a system that is unique in flexibility and breadth of application. Nobel Biocare is the world leader in innovative evidence-based dental solutions.

GLASGOW, UK: A new global network that aims to unite dentists of Indian origin from around the world was recently launched at the British Dental Association conference in Glasgow in the UK. Created by former Chief Dental Officer of England, Prof. Raman Bedi, whose parents migrated from India in the 1950s, Dentalghar is expected to link thousands of dentists who share common values. Health care education market leader Smile-on and Henry Schein Minerva are supporting the project which went online in June.

Members of Dentalghar, which means the ‘home of dentistry’, will be able to contribute to a number of polls, surveys and articles, a spokeswoman for Smile-on told Dental Tribune.

Professionals looking to study abroad will also find information on work permits, visas and qualifications on the platform. She added that there will also be an opportunity to win bursaries and to contribute to volunteering in the UK and globally.

Prof. Bedi, who hopes that Dentalghar will become a ‘major force in the industry’, said: “The focus is on the subcontinent (Pakistan, India, Nepal, Bangladesh and Sri Lanka) and the diverse ‘Asian’ dental communities that have sprung up in regions as far apart as the US, Canada, the UK, South Africa, Singapore, Australia and the Middle East. We have more worldwide dentists of BIPS (Bangladeshi, Indian, Pakistani, Sri Lankan) origin than our medical colleagues.”

This factor, among others, gave rise to the momentum for starting Dentalghar, Bedi added.

“With an increasing number of dentists of Indian origin and a growing economy in India, Dentalghar will help us to work collectively,” Bedi said.

Dental snapshots in 3-D

Under contract by the German dental company Hint-ELs, an expert team at the Fraunhofer Society in Jena, Germany, has developed a new optical digitisation system that scans the oral cavity and captures 3-D data of the teeth, using camera optics. The system is designed to facilitate the production of dental prostheses, in order to supersede the intricate and laborious route from bite impression and plaster mould to model scanning in dental laboratories.

“The 3-D coordinates of the tooth surface can be determined on the basis of measurements taken in the patient’s mouth,” says Dr Peter Kühnstedt, Group Manager for 3-D Measurement Technology at the Fraunhofer Institute for Applied Optics and Precision Engineering IOF. “After an all-around measurement, it is even possible to represent the complete jaw arch as a virtual computer image.”

In order to obtain precise results, the researchers have utilised fringe projections in which a projector shines strips of light on the tooth area to be measured. From the phase-shifted images, a evaluation software determines the geometric contour data of the tooth. Two camera optics provide the sensor chip with image information from different measurement perspectives. After the pixel-precise comparison of various camera images, the evaluation programme identifies any image faults and removes them from the complete image.

Since patients are moving while the images are being, the researchers have ensured that the process is quick. “The image sequence for each measurement position is captured in less than 200 milliseconds,” explains Dr Kühnstedt.

The Aesthetic Element for Zirconia Restorations...

VINTAGE ZR veneering porcelain system offers a comprehensive selection of unique shades that facilitate simple and efficient fabrication of life-like zirconia restorations with excellent colour harmonization to natural teeth.
