Convenient and reliable instrument reprocessing

An interview with Dr Diego Vezzoli, Italy, about the new Lisa steriliser from W&H

By DTI

Hygiene is of top priority for many dental practices. In addition to increased safety for both the practice team and the patients, the efficient structuring of workflows with state-of-the-art reprocessing technologies plays a particularly important role. Dr Diego Vezzoli, a dentist at the Studio Dentistico Eurodent in Palazzolo sull’Oglio in Italy has been using the new Lisa from W&H for several months. The W&H steriliser provides support in the form of rapid, reliable instrument reprocessing for practice to cope with an average daily treatment volume of 20-40 patients. The 8-member practice team truly values the advantages offered by the new Lisa. In a recent interview, Dr Vezzoli spoke about the advantages of the new W&H sterilizer.

“The simplicity of the system is a considerable advantage.”

What role does the new Lisa play in the hygiene cycle in your practice?

Dr Vezzoli: It is very important. The new Lisa sterilizer from W&H boasts optimized cycle times and thus speeds up our day-to-day work. The reprocessing time between patient treatments is now very short, so the instruments are readily available for the next use.

The simplicity of the system

Dr Diego Vezzoli is clearly delighted with the new Lisa. In addition to the simple integration in the hygiene process, the sterilizer also supports rapid and reliable reprocessing of instruments.

Nowadays, comprehensive quality management is a fundamental standard in every dental practice. At the same time, patient safety is always afforded top priority. As such, complete documentation of sterilization cycles is indispensable. How does the new Lisa support you in this task?

I’m very satisfied with my investment. And it’s not just me, my practice colleagues are also very happy with the new Lisa.

Thank you for your time!
