Popular Energy Drinks Cause Tooth Erosion

For more than 10 years, energy drinks in the United States have been on the rise, promising consumers more "oomph" in their day. In fact, it is estimated that the energy drink market will hit $10 billion by 2010. While that may be great news for energy drink companies, it could mean a different story for the oral health of consumers who sometimes rely daily on these drinks for extra boost.

Previous scientific research findings have helped to warn consumers that the pH (potential of hydrogens) levels in beverages such as soda could lead to tooth erosion, the breakdown of tooth structure caused by the effect of acid on the teeth that leads to decay. The studies revealed that, whether diet or regular, ice tea or root beer, the acidity level in pop and beverages that consumers drink every day contributes to the erosion of enamel.

However, in a recent study that appears in the November/December 2007 issue of General Dentistry, the Academy of General Dentistry’s (AGD) clinical, peer reviewed journal, aworthy differences in the number of very basic health needs. Taking care is nothing. I have seen much worse things." He was in the United Arab Emirates during the 2003 bombardment of Baghdad.

For three consecutive days, students were able to understand, make them not only understand, but also be able to apply theory to practice. Opinions expressed by authors are their own and may not reflect the manufacturer’s product news accurately, but cannot assume responsibility for the facts or conclusions presented.

Dr. Mohammed H. Al Jishi, Bahrain

In fact, Raymond Martin, DDS, MAGD, AGD spokesperson, says he treats more patients in their teens to 20s for tooth erosion. "They drink a great deal more sodas, sports drinks, and energy drinks," he says. "The results, if not treated early and if extensive, can lead to very severe dental issues that would require full mouth rehabilitation to correct," says Dr. Martin.

He found his team through the Yellow Pages, sending out 500 letters asking for volunteers to treat asylum seekers unable to obtain medical benefits.

Twenty doctors - GPs and specialists - replied. He sent 600 letters to dentists, and heard back from 16.

"I met a family who have been like this [without access to free medical care] for the last seven years," he said. Yet Dr Barnouti is not shocked. "When you are there [in Iraq] and see the 91 war you think being seven years here without medical care is nothing, I have seen much worse things."

He was in the United Arab Emirates during the 2005 bombardment of Baghdad.

Dr Dawood Haddad, 47, who practices in Fairfield, was one of the first GPs to sign up for the scheme. "A lot of my patients come from refugee countries," he said. "I know how much suffering they have been through.

"I don't want them to have more suffering by depriving them of very basic health needs. Taking one patient out of 50 without charging is no big deal." He was in the United Arab Emirates during the 2003 bombardment of Baghdad.

Research participants consumed yogurt made especially for the study. In addition, plaque and gingivitis were reduced in people with bad breath after consuming two yogurts per day. "So we thought two yogurts per day did work for improving (bad breath)," Maeda said.

In addition, plaque and gingivitis was significantly reduced in people with bad breath after the yogurt-intake phase of the study, compared with the initial phase when they did not consume yogurt. However, the authors noted there were no worthwhile differences in the number of oral bacteria in the mouths of people before and after eating yogurt.

Bruce J. Faster, senior staff member in the department of molecular genetics at The Forsyth Institute in Boston, suggested that the authors may not have looked for all the bacteria that were present. "Typically, the bacterial microbiome and the end products are the culprits for the bad breath," he said.

In "In theory," he added, "their hypotheses may be valid. For example, the odor-causing species may have been replaced by some 'good' species in the yogurt."

Researchers collected samples from the participants’ saliva and tongue coatings, and measured volatile sulfide compound concentrations in the air of people’s mouths. Those measures showed that, at six hours, hydrogen sulfide levels decreased in 80 percent of volunteers who had had breath. "So we thought two yogurts per day did work for improving (bad breath)," Maeda said.

Medications Plus Dental Materials May Equal Infection for Diabetic Patients

People who live with diabetes on a daily basis are usually instructed to eat right, maintain regular physical activity, and if necessary, take medication. What many may not know is that these medications that help control healthy insulin levels may lead to unexpected events at the dentist’s office. According to a study in the November/December 2007 issue of General Dentistry, the AGD’s clinical, peer-reviewed journal, diabetic patients especially need to communicate special needs to their dentists. This is due to harmful interactions that could occur because of the materials and medications used at dental appointments.

According to the study, more than 184 million people worldwide have diabetes, and health officials estimate that this figure will double or triple in less than 20 years. “It is imperative that diabetic patients inform their dentist of their needs in order to anticipate medication interactions and physical reactions to treatment,” says Lee Shackleford, DDS, FAGD, spokesperson for the AGD. “The doctor must know if the patient is taking insulin, and has taken their daily dose of insulin, in order to anticipate the length of the appointment.”

Teen teeth bleaching

Girls and boys alike, from elementary to high school, are bleaching their teeth.

“Kids are under a lot of pressure, as adults are, to look good, to have white teeth,” says Dentist Dr. David Carroll.

“White teeth just pretty much make everyone seem more attractive. Even if you have straight teeth and they’re yellow they’re still not that nice,” says Patient Taryn Barg.

Don’t be blinded by the whiteness. Dentists warn that children’s teeth aren’t fully developed. Bleaching can make them overly translucent and trigger tooth and gum sensitivity.

“If I ate certain food it would just kind of tingle and it didn’t feel too good,” says Barg.

“There could be extreme tooth sensitivity if it’s used improperly, if it’s kept on the teeth for too long, and if the directions are not followed closely,” says Carroll.

That should be a red flag to parents who may not know their child is using a tooth whitener.

“If the child all of a sudden can’t drink cold water or can’t eat ice cream for some reason that might be an indication that they have started using some of these products,” says Carroll.

To avoid problems, kids who want whiter teeth should see a dentist before starting the bleaching process.

“Get a thorough examination, find out why, what is the cause of discoloration of the teeth. There’s nothing wrong with over the counter methods if they’re done in cooperation with the dentist and if they’re supervised by an adult,” says Carroll.

Taryn admits she’s addicted

“You just like glow kind of, just makes everything about you look nicer,” she says.

If it isn’t clean, it can’t be sterilised!

Hydrim and Statim, your perfect partners in the sterilisation process

Authorities now recommend that instruments cannot effectively be sterilised unless they have first been cleaned in a mechanical washer. Across Europe guidelines are under review to reflect this advice.

That’s why effective sterilisation begins with the Hydrim CS1/3w1d or M2 instrument washer. After a pre-wash to remove virtually all proteins, two independent, high pressure sprays clean the instrument load from above and below, removing virtually all organic debris. Independent tests show an efficacy of 99.9 – 100 per cent. The Hydrim washers perfectly prepare instruments for sterilisation in as little as 19 minutes, and eliminate the risk of washing instruments by hand.

Now you can eliminate the risk of hand washing instruments

Following the Hydrim wash cycle, the instrument basket can immediately be transferred into an S class Statim® autoclave cassette for the fastest sterilisation cycle available. Most instruments, including handpieces can now be sterilised between patients in a Statim 2000 S in only 8 minutes. The fast Statim S cycle process fully complies with the latest European standard EN13060.

The compact Hydrim CS1/3w1d and Statim units are designed for benchtop use and are the perfect partnership for the central sterilisation area even in the smallest practice. The floor standing Hydrim M2 can process about 100 instrument sets in a 10 hour day and is ideal for the larger, busy practice.

Are graduates of dental school ready for the reality of practicing dentistry? Four out of five dentists don’t think so, according to a survey by The Wealthy Dentist, citing a lack of business savvy and little knowledge of dental practice management.

Many feel that dental school must also fill the role of business school. “Dental school needs really good business courses to help students get started in practice, even if they are going into an employment situation,” opined a Tennessee dentist.

But is business training really within the scope of dental school? “Today’s graduates are not prepared to start a business, but neither were we. Business sense is hard to get in a classroom setting,” observed a North Carolina dentist. “It’s like preparing for parenting: how do you know when you’re ready?”

Though dental technology has advanced rapidly, it’s not clear that dental education has followed. “It has not changed enough in at least the last 25 years. Clinically, dental students have just enough knowledge and experience to provide basic care and hopefully will understand that they need to continue to learn and develop their capabilities,” wrote an Illinois dentist. “There should be some basic business requirement in the pre-dental education, but I don’t see that there is room in dental school to cover this (running a business) in any but the most cursory way.”

Doing well in dental school is no guarantee that a student will become a good clinician. “Dental school prepares you for your board exams, not the real world of dentistry,” commented a New Jersey dentist. “Academically graduates are over-prepared, and clinically they tend to be under-prepared,” agreed a general dentist from Missouri.

Of course, some feel that dental schools provide an excellent education. “Dental school has tried to address issues of practice management, dental insurance issues, and advanced restorative techniques including implants and periodontal surgery,” said a Pennsylvania periodontist.

One Michigan dentist reported being disappointed by his young associates. “I have gone through a few associates. I have a high-tech, high-end practice, and I try to show them all the tricks. They are not only clueless, but they don’t even try—poor confidence level out of school. They want to make the money but they don’t want to work the hours or try to learn the communication and practical skills that today’s public demands... I think that in the future I’m going to charge a training fee!”

“Dental schools might be great, but they’re notoriously bad at addressing business issues,” said Jim Du Molin, dental management consultant and founder of The Wealthy Dentist. “Students learn lots of science and very little about practice management. But how can graduates expect to practice dentistry if they can’t run a dental practice?”

**Dental School Is Not Business School**

---

**Our technology — Your know-how**

**FGK RaCe NiTi Instruments & SafetyMemoDisc**

**Canal treatment in continuous rotation. Safe, simple and efficient!**

**NON-CUTTING SAFETY TIP**
- Perfect control of the instrument
- Steers clear of lateral canals

**ALTERNATING CUTTING EDGES**
- No threading, no blocking effect
- Lowest operation torque & reduced working time

**SHARP CUTTING EDGES**
- Improved efficiency
- Better debris evacuation

**EXCLUSIVE ELECTRO-CHEMICAL TREATMENT**
- Better resistance to torsion and metal fatigue
- Facilitates cleaning and sterilization

**COMPATIBILITY**
Our instruments are suitable for all micromotors and controller systems
