Case study: Herculite® XRV Ultra™ and OptiBond™ XTR
Supporting the future generations in dentistry

By Kerr

A 52-year-old patient presented with a request to replace defective, old restorations and improve the aesthetics of the smile.

A decision was made to remove the old restorations from teeth 11, 12, 21, and 22, as well as per- forming coronoplasty to improve the final aesthetic results. For reasons related to the patient's health, the treatment was performed over two sessions.

For the bonding procedure, the 2-step self-etching bonding system OptiBond XTR was chosen. The clinical procedure consisted of the application of a self-etching primer that changes the morphology of the enamel surface depending on its pH, followed by the application of the adhesive.

The pH of OptiBond XTR Primer is 2.3 and decreases to 1.7 during application. Then it switches to a value of 7, due to a chemical reaction with the calcium ions of the dental tissues. OptiBond XTR performs very well on the dentine surface as well, dissolving the smear layer effectively.

The self-etching primer was applied using a microbrush with gentle and active brushing for at least 20 seconds in order to promote the remineralisation and the infiltration of the substrate (“continuous brushing technique”). The solvent was evaporated using an indirect and gentle air stream.

The adhesive was applied using a microbrush with active “scrubbing”, waiting for 15-30 seconds in order to obtain the diffusion of the resin by capil-

larity into the substrate and the excess was removed through a capillary action into air stream and light substrate, and for 10 seconds, using the LED curing light Kerr Demi Ultra.

The main benefits of using the OptiBond XTR Bonding System are:

1. Fast application and predictable results
2. No need to rinse and therefore no risk of issues related to moisture control of the dentine surface
3. Good bond strength to both enamel and dentine
4. Excellent fit of composite to restore the shape of tooth in a single step, without the need of using a mock-up technique.
5. No need to rinse and there-

stratification of the composite.

Knowing the functional and aesthetic features of Herculite XRV Ultra composite, the cavity was prepared by completely removing the previous restorations and any carious dentine, without removing the discoloured/secondary dentine, which will be perfectly masked by the opacity of the dentine shade of Herculite XRV Ultra.

The opacity of Herculite XRV Ultra Dentine shade is able to cover the dentine discouloura-

tion without the need for further opaque shades. The application and sculpting of the composite was performed using the Kerr Comporellor, a useful modelling tool that consists of a handle and interchangeable tips with different shapes to use depending on the type of restoration. Moreover, thanks to the unique material of which they are made, the composite doesn’t stick to the tips and therefore its placement is fast and easy.

Polishing and high-gloss polishing of the restoration was performed in few fast and simple steps. Unlike other materials, Herculite XRV Ultra makes it possible to obtain high aesthetic results with a natural appearance in few minutes.

The results achieved show that use of Kerr Herculite XRV Ultra composite materials in the anterior can achieve a significant aesthetic improvement of the smile using conservative techniques and without recourse to prosthetic solutions.

In addition, the use of Herculite XRV Ultra as an anterior restorative can achieve a significantly improved aesthetic smile without using indirect restorations.

About the Author

Marco Bambace is currently a student at the University of Padova (Department of Dentistry) in his fifth year of studies. He will achieve the degree of Doctor in Dentistry in 2016. With his talent for direct restorations, Marco Bambace performed this in vivo case using Kerr restorative products and filling accessories.

Advanced Restorative Techniques and the Full / Partial Mouth Reconstruction - Part 1

As an introduction to a series of articles, Prof. Paul Tipton looks at restorative techniques and the impact of new dental materials

By Prof. Paul Tipton, UK

Most advanced restorative dentistry techniques, including that of full mouth reconstruction, have changed very little over the last 20 to 50 years. However, the impact of new dental materials, such as titanium and zirconia, has had a major influence on aesthetic dentistry and implantology during this time period. As a result, the profession may have an over-reliance on new materials rather than tried and tested techniques.

Some fundamental techniques are just as relevant today as they were when I started my Masters degree in conservative dentistry at the Eastman Dental Hospital in 1987. During the course of this series of articles on advanced restorative techniques, some old techniques will be revisited in light of today’s aesthetic and restorative requirements and some newer concepts will be discussed in greater detail whilst dealing with the overall topic of full mouth reconstruction. This article previews the restorative techniques that will be discussed during the next 10 clinical articles on advanced restorative techniques.

Occlusal concepts

During my Masters degree at the Eastman and prior to that, my training in occlusion has been in gnathology and its principles as taught at the University of Michigan and by Bjorn Dahl. Since then they have gradually been incorporated into the field of restorative dentistry although many Orthodontists still dispute their efficacy and relevance.

Dahl appliances

Bjorn Dahl first described the Dahl appliance in the early 1970s. Since then they have gradually been incorporated into the field of restorative dentistry although many Orthodontists still dispute their efficacy and relevance.

Dahl appliances

Bjorn Dahl first described the Dahl appliance in the early 1970s. Since then they have gradually been incorporated into the field of restorative dentistry although many Orthodontists still dispute their efficacy and relevance.
The article on Dahl appliances will cover its history and usage in today’s modern restorative dentistry, focusing on the use of traditional chrome cobalt ‘Maryland wings’ style of Dahl appliances and also the use of splinted temporary or prototype restorations used to gain space during crown procedures (Figures 13-15).

Duralay bonnets

Impression techniques demand a high degree of accuracy for the completion of the advanced restorative case. Often this is a difficult procedure for the restorative dentist when taking impressions both sides of the mouth at the same time (as a full arch impression where there are multiple teeth present) or undertaking an impression of mobile teeth as in the Lindhe/Nyman bridge.

Both of these techniques will be reviewed and clinical examples shown of how the duralay bonnets and coat hanger wire technique can be used not only for impressions but also for jaw registrations (Figures 16-18).

Periodontal prosthesis

The article on the periodontal prosthesis, commonly known as the Lindhe/Nyman bridge, reviews all the literature from the 1970s on this exciting technique, which allows multiple pontic replacement in fixed bridgework on often severely mobile and reduced number of abutment teeth. The science is overwhelmingly in favour of this type of bridge in certain situations where conventional dentures or implants are not possible (Figures 19-21).

Peter Wohrle bridgework

The duralay bonnet technique also crops up in this article on individual crowns cemented onto a pink porcelain fused to metal bridgework cemented onto gold copings and then onto abutments screwed into dental implants – hence the abbreviated name ‘Peter Wohrle bridgework’ for ease of use after the dentist who first described the technique. Several cases will be described using slightly different techniques to illustrate the technical difficulties in producing this bridgework but demonstrating the overall superior aesthetic result, optimal fit and maintenance potential (Figures 22-24).

Aesthetic periodontics

The last article in the series reviews the latest techniques in periodontology used to enhance optimal aesthetic restorative techniques. The periodontist is an essential team member of the aesthetic restorative practice and an increasing amount of patients are requiring pink as well as white aesthetics. Connective tissue grafting, pontic site development, crown lengthening etc will be reviewed and discussed with step-by-step protocols (Figures 25-27).

Conclusions

Restorative dentistry has gone full circle with old techniques revisited and amended for today’s dentistry. These techniques do not, however, get enough ‘air time’ in many journals as the importance of aesthetics takes over. It is my aim to help the reader understand these advanced restorative techniques and encourage them to put them into their everyday practice in order to help their patients and gain more clinical satisfaction.

For the writing of this article on advanced clinical techniques, I would like to thank certain members of my team, including Dr Ibrahim Hassain, BDS, M.Med.Sci.Implantology – implant surgeon, Mr Bradley Moore – dental technician, ADS Laboratory, Harrogate and Dr Andrew Watson, BDS, MSc, specialist in endodontics.
