The New Frontier of Interceptive Aesthetic Orthodontics

How the simple “3-Step Smile” can offer far more than you might realize. Dr. Tif Qureshi, discusses how the treatment of mild and moderate crowding has far more than just cosmetic orthodontic objectives.

By Dr. Tif Qureshi, UK

Currently in the market of dentistry it seems as if they are 1000 short-term orthodontic systems out there. The term “cosmetic orthodontics” has been around for a little while but in this article we are going to take an alternative view of what we can achieve. The problem with the term “cosmetic” is that it often suggests things are being done just for visual reasons. This article will argue that in treating mild and moderate crowding cases we are potentially carrying out an interceptive functional treatment.

There have been criticisms from people suggesting that the cosmetic orthodontics and short term orthodontics causes anterior flaring and loss of control of the anterior occlusion. This may be true if there has been no arch evaluation/planning or space creation strategy. If these things have been carried out then actually the opposite is true, and arguably every better control of the anterior occlusion than in any other form of orthodontics.

This article will also look how simple three-step approach can massively improve the patient’s appearance, their function and intercept the continual crowding life causes more problems without the need to pick up a drill or damage any teeth.

This three-step approach we call the ‘three step smile’ through alignment bleaching and bonding. With the right components carried out at the right time it is possible to make the patient’s own teeth look more beautiful without the need for porcelain veneers or other irreversible procedures.

The most important article in dentistry that the profession seems to miss is Br J Orthod. 1990 Aug; 17(3):235-41. Stability and relapse of dental arch alignment.

Little RM
1. Arch length reduces following orthodontic treatment, but also does so in untreated normal occlusions. 2. Arch width measured across the mandibular canine teeth typically reduces post-treatment whether the case was expanded during treatment or not. 3. Mandibular anterior crowding during the post-treatment phase is a continuing phenomenon well into the 20-40 age bracket and likely beyond. 4. Third molar absence or presence, impacted or fully erupted, seems to have little effect on the occurrence or degree of relapse. 5. The degree of post-retention anterior crowding is both unpredictable and variable and no pretreatment variables either from clinical findings, casts, or cephalometric radiographs before or after treatment seem to be useful predictors.

This 40 year study is so important

The New Concept of Alignment, Bleaching and Bonding Certification Course

Bahrain
8th May 2016 | 09:00 - 18:00

Singapore
29th July 2016 | 09:00 - 18:00

Malesia
1st August 2016 | 09:00 - 18:00

Trainer
Dr. Gun Norell, Sweden

Course Outline
- Philosophy and history of orthodontics objectives
- The mechanics of the human alveolus
- Case Selection
- Arch Evaluation, Space calculation, transpalatal expansion and retraction
- Case Presentations: A large portfolio of varied cases will be shown and will be discussed
- Treatment of anterior openbite, crowding and crossbite
- Third molars: impacted and fully erupted
- Treatment planning and case selection
- Treatment of mild crowding
- Use of clear aligners in mild human anterior crowding

Conceived by dental educators and designed by world-class Italian designers, the Smily Dental Simulator is a patented and multi-dimensional teaching modality.

Its modular construction addresses space considerations while providing self-contained learning islands for ultimate teacher/student interface. In addition to teaching simulation the Smily platform incorporates multimedia capabilities that enhance the teaching process and accommodate the growing requirement for audio, video, data processing and image guided technologies: EasyTeach 3D and EasyLearn.

EasyTeach 3D permits the video-transmission of lesson to all connected positions, monitoring in real-time all students. EasyLearn is a revolutionary computerized dental training system. It uses the latest in optic, imaging and simulation technologies to give the dental student the best and most effective training experience available in the world today. As s/he practices procedures, the dental student is provided with case history information about the simulated patient, on-screen visual tracking of the procedure s/he is performing, real-time digital feedback and evaluation of procedures performed.
for two main reasons. The first highlights the point now widely accepted that retention after orthodontics is for life.

The second point is even more important: that in adults with mild or moderate crowding, the arch length will reduce regardless of whether the patient had orthodontics or not.

This is a critical point for all dentists to understand especially anyone carrying out restorative treatment. That is the teeth you have restored that you may expect to remain in the same position through life will keep moving and the functional contacts will change. It is one typical reason why composite fillings classically chip on the front teeth. Bascially if you have crowded it will get worse and arch width will collapse which may have an effect on the patient’s guidance. It also means that lower incisors, which have wear facets due to crowding caused by irregular dynamic contacts, will get worse and wear faster causing more dentine exposure and darkening from the soaking of stain.

These two patients were told 25-30 years ago that the upper teeth needed treatment but the lower were not crowded enough to treat. At the time they were not that crowded, but over time as per the findings of Little’s study the teeth have continued to crowd causing the evident result.

This patient was treated 10 years ago that the upper teeth needed treatment but the lower were not crowded enough to treat. At the time they were not that crowded, but over time as per the findings of Little’s study the teeth have continued to crowd causing the evident result.

This patient was only 21 and her crowding was getting worse, as was the differential tooth-wear on her lower teeth. Her canine guidance was collapsing and she was slowly moving into group function. Her lower incisors were starting to wear differentially. After aligning her teeth in 9 weeks and fixed retainer, her canine width was increased and held, function returned and 7 years later there has been barely any increase in wear in the lower edges Fig 8 Cara.

Detailed case
This case example will go through the steps needed for the three-step smile, and outlined planning and consentening processes involved.

This patient presented originally wanting porcelain veneers. However, he was aware of the high costs and that it would involve heavy prepa ration on his teeth so he decided to consider aligning his teeth. When he was shown the results possible with composite bonding and bonding the patient decided against veneers altogether.

After a full examination and orthodontic assessment, our first step was to decide on a landmark reference tooth. This is a tooth, which is considered aesthetic by the patient and aesthetic and functional to the clinic.

An Arch evaluation and an occlusal trace is carried out with this reference point in mind using Spacesense software, so that the 3-D setup created by the technician following the exact prescription of the dentist. In this case it was decided that the canines were in an ideal position so we certainly should not be framed on the set up. The curve strictly dictated the position to be achieved (Fig SW trace)

It was discovered when considering the landmark point in looking at a chin up view, that to achieve the ideal upper position, a lower tooth was in the way and would need treatment (Fig 9)

A full 3-D digital setup was produced by the laboratory based on this curve this was checked by the dentist before going ahead. A 3-D model was then produced, which the before and after positions. The patient has shown the print before any aligners were built. This ensured he was fully consented that he understood the potential compromises of only treating the anterior teeth. The patient reviewed the models in his hand and was happy with what was proposed. The 3-D models were returned to the lab and an upper Inman aligner and lower Clear Smile aligners were built on the setups.

A full Inman aligner space creation guide with provided that outlined not only IPR but also PPR (predictive proximal reduction)-understanding this makes the difference between average aesthetic and superb aesthetic results.

Progressive space creation was carried out over a period of 12 weeks. The patient’s teeth started to align.

Simultaneous bleaching
Towards the last part of treatment bleaching trays were made the patient started bleaching teeth simultaneously. Impressions were taken and super sealed trays were made on the nearly aligned teeth - 6% Day white whitening from Philips was given to the patient with full instructions. He carried out bleaching once twice a day for 35 minutes at a time.

At two weeks notice a significant improvement in the tooth colour. A mockup outline was carried out using flowable composite- and the patient was happy with the proposed build-ups, which involved 4 teeth.

Edge Bonding
2 weeks later the edges were permanently built using Venus Diamond and a very simple 2-layer reverse triangle technique. No preparation was required.

The retainer was fitted on the same day using a jig made on an impression post alignment. This was bonded using Venus Flow.

Conclusion
One can see the natural-looking end result of this patient. He was thrilled with the fact that the treatment simply made his own teeth look as good as they possibly could, rather than totally changing his appearance and feeling as if someone else’s teeth were in his mouth. More significant is the fact that this could be done by any dentist with the simple “Three steps smile” alignment bleaching and bonding, with far less risk, better accepting and arguably a far more natural outcome than traditional veneer preparations. With upper and lower fixed retainers in position, canine widths and guidance can also be maintained, meaning reduced chance of composite fracturing to lower and function long-term aesthetics. The 2 year follow up showed no changes in occlusal contacts or shifts in guidance.

“Three step smile” alignment bleaching and bonding, with far less risk, better accepting and arguably a far more natural outcome than traditional veneer preparations.

Dr. Tif Qureshi, UK
He is a Director of Intelligent Alignment Systems.
You can learn about the Unique mentioned Pathway of Learning from 456 starting with Inman Aligners and Clear Smile Aligners, then Clear Smile Beaus roof up to Clear Smile Advanced taught by Professor Russ Fickson by visiting www.lateronomy.com.
Dr. Tif Qureshi will give two hands-on courses at 11th CAD/CAM & Digital Dentistry Int Conference in Dubai.
An interview with Dr. Gun Norell

By Dental Tribune MEA/CAPPmea

Dental Tribune MEA & CAPPmea: A true pleasure having the opportunity to interview Dr. Gun Norell. You have been quite active in the Middle East since 2007 now. Could you elaborate on your experience in the region and the experience behind working in Dubai as a dentist?

Dr. Gun Norell: To work as a Dentist in this region has been a wonderful experience but also a great challenge, since we have a multicultural population. Everyday I meet patients with different needs and complaints. Some of them need comprehensive multidisciplinary treatments while other patients only need small cosmetic treatments. It is very important to listen carefully and respect every individual patient. This means I continuously have to develop my skills.

You have famously become an advocate for minimal invasive dentistry and the Inman Aligner Academy, how were you first exposed to the possibilities behind the Aligner, Bleaching and Bonding concept/treatment and why did you start?

First time I heard about Inman Aligner was in the US when I attended a meeting AADNT (American Academy for Dental Cosmetic) and talked to a Swedish colleague. She told me about the Inman Aligner and the concept with bleaching and bonding. This immediately caught my interest so I signed up for next Certification course in London 2001. After the course I couldn’t wait to get back to Dubai and start treating my patients this way. Finally I had the knowledge and the treatment to give my patients a great smile in a fast, safe and predictable way that fits the lifestyle of most people in UAE. As predicted, the Inman Aligner treatment has been a great success from the very beginning and the treatment usually only takes 6-16 week.

With the experience you have in the region, why is minimal invasive dentistry so important for the patients as opposed to invasive dentistry?

Most people want white, straight teeth and a beautiful smile but they are not convinced from beginning. It is never too late to learn new techniques. Always listen to and be honest with your patient - that will make you trust you and feel confident with you. For me Inman Aligner truly change my way of thinking of Dentistry. After 30 years in the business I’m still excited every morning going to work to see what new day has to bring.

The Inman Aligner treatment has been a great success from the very beginning and the treatment usually only takes 6-16 week.
