The research found unique proteins for the fibroadenoma benign tumor, the most common benign breast tumor,” Streckfus says.

Over the next 25 years, 25 million women throughout the world are expected to develop breast cancer, and 10 million are projected to die from the disease.

Streckfus collaborated on the study with William Dubinsky, Ph.D., a biochemist and professor of integrative biology and pharmacology at the University of Texas Medical School at Houston, and Lenora Bigler, Ph.D., a clinical research professor with the UT Dental Branch.
