The age-old question as to what constitutes beauty has been subject-ed to yet another wrinkle. Research has been presented showing that left-sided brain people perceive beauty differently than right-sided ones. Beauty is and has been per-ceived through the ages through individual eyes. Perhaps different cultures encourage different zones of desire and contentment; also, people of different ages may have different views. Whatever the cause or conditioning, our visions encour-age that beautiful zone. Is it due to our youth’s environment, perhaps where our mother’s left side of the brain influenced our concepts early, relating to beauty?

When I was presenting cosmetic periodontal techniques in Sicily, Italy, at a congress dedicated to periodontal techniques in Sicily, a congress dedicated to esthetics in dentistry, Dr. DeLuc-ca, an exquisite prosthodontist with exceptional esthetic prosthet-ic results, brought up factors and questions regarding the effects of esthetics from the right and left sides of the brain as well as the male/female dominance in their respective spheres. The brain has been relegated to different functions on its left and right side in several factors. The right side is said to be more analyti-cal, more detailed, as well as more scientific, mathematical, computer-istic, logical and analytical. In gen-eral, the right side is usually related to males.

The left side of the brain is, in general, attributed to the female gender. Its characteristics are said to be non-verbal, intentional, emo-tional, excellence in spacial rela-tionships, and good color percep-tion.

In the past 20 plus years of den-tistry, esthetics has changed the face of the profession. This is not meant to be a pun but an actual fact. The desire by patients to electively choose to have dentistry is a huge leap from its image of yesteryear. Not relying on motivation from pain or trauma, patients are eagerly trying to improve their appearance orally. A wonderful bright smile can light up the face and the public is now aware of this fact.

At about the same time that cos-metic improvement was encour-aged by our profession, the profile of the dental school population started to change. The number of female dental students became more pre-dominant than ever before in the United States. Was this the left side of the brain making its mark?

The initiating pioneers in the dental aesthetic field, Drs. Irwin Smigel and Ron Goldstein, forged awareness to the public as well as the dentists, and encouraged the patient to request looking better orally. In turn, they encouraged the dentist to provide the services that stimulated dental companies to research and provide better esthet-ically appearing, yet formidable, restorative materials. Did it take these pioneers the use of the right side of their brain to forge this field of esthetics?

In other countries throughout the world, the number of female dental school graduates has been higher than males for years. In addition, 85 percent is the com-mon percentage of female dentists practicing in many such countries. In the U.S., that number hovers at about 30 percent.

Does the right side of the brain dominate our field with the neces-sary precision that is demanded? Have the materials in dentistry today improved so much that there is compensation in techniques to allow the left side of the brain’s activity to transcend and emit an aesthetic sensitivity for the patient’s appearance? Can the individual dentist utilize the left and right side of his or her brain as noted in today’s terminology by the expres-sion “crossover”?

Will the economic turmoil of today affect the demand by patients for cosmetic dentistry beyond the necessary health requirements? I know that for me to find the answer regarding the male/female, left and right brain relationships, I should smilingly have to ask my wife.

About the author

Dr. David L. Hoexter is direc-tor of the International Academy for Dental Facial Esthetics, and a clinical professor in periodontics at Temple University, Philadel-phia. He is a diplomate of implan-tology in the International Con-gress of Oral Implantologists as well as the American Society of Osseointegration, and a diplomate of the American Board of Aesthetic Dentistry.

Hoexter lectures throughout the world and has published nationally and internationally. He has been awarded 11 fellowships, including FADC, FICD and Pierre Fauchard. He maintains a practice at 654 Madison Ave., New York City, limited to periodontics, implantology and aesthetic surgery. He can be reached at (212) 355-0004 or drdavidh@aol.com.
