Are you a ‘cutting edge dentist’?

By Robin Goodman
Group Editor

Do your patients have open-mouth rest posture?

Have your patient’s teeth moved after orthodontic treatment?

Does your patient exhibit an open bite?

Does your patient complain of temporomandibular joint dysfunction (TMD) or neck pain?

Is the patient’s tongue always “in the way” when you are drilling, scaling or examining the teeth?

Does your patient exhibit a scalloped tongue from pressing against the teeth?

Have you noticed oral habits such as thumb or finger sucking, nail biting, lip licking or hair twirling or chewing?

Does your patient exhibit an open or open-mouth rest posture?

Does your patient grind or clench his/her teeth?

Does your patient have chronic mouth rest posture?

Does your patient have a mouth rest posture?

The critical missing element to complete care: where dentistry and orofacial myofunctional therapy meet (Part 1 of 2)

By Joy L. Moeller, RDH, BS, COM

I. Problems that can be addressed

► Does your patient exhibit a scalloped tongue from pressing against the teeth?

► Have you noticed oral habits such as thumb or finger sucking, nail biting, lip licking or hair twirling or chewing?

► Does your patient have chronic mouth rest posture?

► Have your patient’s teeth moved after orthodontic treatment?

► Does your patient exhibit an open bite?

► Does your patient complain of temporomandibular joint dysfunction (TMD) or neck pain?

► Is the patient’s tongue always “in the way” when you are drilling, scaling or examining the teeth?

► Does your patient exhibit a scalloped tongue from pressing against the teeth?

► Have you noticed oral habits such as thumb or finger sucking, nail biting, lip licking or hair twirling or chewing?

► Does your patient complain of chronic mouth rest posture?
and has a potential greater zone of thermal damage in the wrong hands; it should not be used on pockets deeper than 4 mm. The Nd:YAG can be used to pocket depths above 12 mm. Those interested in the Nd:YAG for gum disease should really look at the PeriLase MVP-7 by Millennium Dental Technologies as the laser is sold with instruction/training in the laser and LANAP technique.

And for lasers and hard tissue such as teeth and bone?

Erbium lasers are great for disinfection of teeth and for osseous surgery as they are specifically made for disinfecting and cutting hard tissue. They are also ideal for preparing class I and class V restorations and removal of defective composite materials; however, they cannot be used on metal or porcelains, as these cannot be cut by a laser.

Metals and porcelains must first be removed using the drill; however, once they are removed the laser can be used directly to remove any underlying caries. If the caries is very deep, the erbium laser can be used in a direct/indirect pulp-capping technique with the immediate placement of a CEREC 3-D porcelain restoration. An erbium laser like the Waterlase MD by Biolase can also be used in the direct treatment of root canals as it has laser endodontic tips that are used post instrumentation for cleaning and disinfecting the canal.

What are your thoughts on a connection between heart disease and periodontal disease?

I love it when patients tell me that they fit and in good shape except, of course, for the severe gum disease they have. Unfortunately, we have grown up with faulty medical/dental health models that describe the body as distinct and disconnected units, and this shows up in how we view disease and the body. Severe infections in the body is dangerous as it can spread, especially to vulnerable organs.

Periodontitis is a bi-directional manifestation of disease. It can be seen as a manifestation of systemic disease such as diabetes, cutaneous disease, joint disease and osteoporosis. It can also be seen separately from systemic ones as its own complete disease with the great potential of releasing bacterial endotoxin into the blood system that can travel to the heart, lungs and other major organs. It has been linked to cardiovascular disease since the late nineties and rightly so, as oral bacteria are not contained but spread and are particularly dangerous for heart patients who are vulnerable to endocarditis, especially before open-heart surgery.

An Nd:YAG laser can reduce microbial colonies that inhabit periodontal pockets by 97 to 100 percent, as the laser is precise, site specific and does not rely on secondary or tertiary effects to kill microbes. It destroys microbes and their colonies on contact without any side effects.

Complete care

Narrow Body Implants to Stabilize, Cushion and Retain Lower Dentures

Participate in the real-time procedure, installing Atlas® implants on a hard model. Retrofit the lab-made aesthetic denture and reline it with the TufLink™ silicone material.

All steps and instruments are precisely the same as used in your office. Participants keep the model for staff training and patient education.

2008 Workshop Schedule

Nov 5 New York, NY
Nov 5 Chicago, IL
Nov 14 San Francisco, CA
Nov 17 Miami, FL
Dec 10 Charlotte, NC
Dec 12 Anaheim, CA
Dec 15 Las Vegas, NV

Accreditation: 4 credits will be awarded upon completion of the course.

Keith Rosselin, DDS
Hands-on Course Instructor

Barrett, William Zirkenfoose, and Galen Peachey founded the International Association of Orofacial Myology (IAOM). Currently the IAOM is the main professional organization in the world promoting and developing orofacial myofunctional therapy.

The team approach

Today the field is expanding to include many professions. Through a team approach, the patient can experience the best of all worlds and achieve remarkable results. The interdisciplinary approach to patient wellness includes but is not limited to:

- orthodontics
- general dentistry
- speech-language pathology
- dental hygiene
- periodontics
- oral surgery
- ear, nose and throat specialty
- cranial osteopathy
- allergology
- pediatric dentistry
- pediatrics
- physical therapy
- chiropractics
- gastroenterology
- plastic surgery

Failure to help many patients

Through 50 years of practicing orofacial myofunctional therapy, some questions patients or their parents asked me include:

- Why didn’t someone tell me about this earlier?
- I knew I had a tongue thrust, I didn’t know there was a special person to help me.
- Why didn’t someone tell me my habit of tongue thrusting, thumb sucking or nail biting could be easily eliminated in therapy?
- I have tried multiple splints, functional appliances, medications and occlusal adjustments for my TMJ problem. I was even referred to a psychologist for counseling because they told me it was stress related. Why didn’t someone recognize my facial muscle dysfunction and refer me for orofacial muscle therapy sooner?
- This is the third time my orthognathic surgical result has relapsed. Why hasn’t anyone referred me to an orofacial myofunctional therapist?
- My child was traumatized by wearing a “rake” in his mouth to stop his tongue thrust. His speech has gotten worse and he has withdrawn. After the rake was removed, the tongue thrust returned. Why wasn’t I given the option of seeing a therapist who specialized in treating this disorder with exercises?
- My child wore a palatal expander for a high narrow palate. After the expander was removed, the palate collapsed because the tongue was resting down. Why wasn’t I referred to an orofacial myofunctional therapist immediately following the expander being removed?
- I was told I was tongue-tied and needed a lingual frenectomy. After surgery, my tongue reattached and scar tissue formed and was worse than before we started! Why wasn’t I told to see a therapist immediately following surgery to prevent re-attachment?

Patients can learn to develop healthy muscle patterns. Healthy muscle patterns, when permanently habituated, can be proactive in preventing or treating:

- orthodontic relapses,
- articulation disorders,
- breathing disorders due to allergies or mouth breathing habits,
- TMD when it is a muscle or habit-related issue,
- digestive disorders from not chewing properly or swallowing air,
- postural problems,
- faster normalization of the facial muscles and neuro-muscular facilitation post orthognathic surgery.

How can orofacial myofunctional therapy help the general dentist?

Orofacial myologists can assist the dentist in many aspects of his or her practice to:

- Re-educate muscle patterns that promote a stable orthodontic result.
- Reduce the time spent in fixed appliances.
- Normalize the inter-dental arch vertical rest posture dimension, the freeway space, also called the oral volume.
- Identify and eliminate orofacials noxious habits that interfere with stable occlusal results.
- Teach nasal breathing and remodel the airway through nasal cleansing and behavior modification.
- Reinforce compliance with wearing rubber bands, functional appliances and retainers.
- Develop a healthy muscle matrix and eliminate habits that contribute to TMD.
- Correct head and neck posture problems.
- Stabilize the periodontal condition by reducing tongue thrusting pressures and mouth breathing habits.
- Because most of our patients are in need of orthodontic treatment or treatment by a functional dentist, if the patient was referred by a source outside of dentistry, we are certainly a great potential referral source for dentists.
- The best time for the dentist to refer the patient to an orofacial myofunctional therapist is before intervention by appliance therapy. It is always best to do the least invasive treatment first and eliminate habits that are interfering with treatment. This will ensure that the muscles are working with the forces of the appliances. Also, another good time to refer would be before the braces come off, depending on the patient’s facial structure and motivation. We can work together to help the motivated patient achieve amazing results.

To elaborate on the importance of the working relationship between OMTs and the dental community, I have reached out to some of my esteemed colleagues for commentary.

According to Dr. John Kishibay, an orthodontist from Santa Monica, Calif., who is a professor at USC School of Dentistry: “Orofacial myofunctional therapy must be part of the treatment plan from the beginning. This way the patient understands from day one that the muscle adaptation is important for long-term stability. Especially important would be the orthognathic patient. The patient must learn to use the new space in an ergonomic manner, in both a functional patterning and habit elimination awareness.”

Dr. William Hang, an orthodontist practicing in Westlake Village, Calif., believes that OMT problems are one cause of poor facial development. He says: “Stability will continue to be an elusive, unachievable goal with poor facial balance frequently being the norm of the post orthodontic result. Myofunctional therapy must become the first line of defense in the quest for proper facial development rather than the rescue squad when the orthodontic result is going up in flames. When orthodontists embrace myofunctional therapy, they stop treating symptoms and begin to focus on treating the cause of poor facial development [altered oral rest posture].”

Dr. Jerry Zimringer, a practicing orthodontist for 44 years in Los Angeles, believes that attaining proper occlusion is a state of balance between the teeth, the muscles and the bones. He states, “Both my daughter and my grandson were treated with myofunctional therapy with excellent results that would not have been possible without this valuable treatment. I feel strongly that myofunctional therapy should be part of every orthodontic practice.”

Dr. Richard L. Jacobson, a Diplomate of the American Board of Orthodontics who has been in the exclusive practice of orthodontics in Pacific Palisades, Calif., for the past 28 years, stated: “We know that form follows function and function can follow form. Therefore, it is vital to identify those patients that need myofunctional therapy. In these patients myofunctional therapy by a specialist is essential. Treatment is effective and orthodontic stability is enhanced.”

The author would like to thank Karen Macedonio, a Certified Life Coach (and patient), Barbara J. Greene, COM, and Licia Coccaini-Paskay, MS, CCC-SLP, COM for their assistance with writing this article. A complete list of references is available from the publisher.

To find a therapist near you, go to www.iaom.com and look at the directory.

Joy Moeller, BS, RDH, COM, is a certified orofacial myofunctional therapist and a licensed registered dental hygienist. She is in the exclusive private practice of OMT in Pacific Palisades and Beverly Hills, Calif. She is currently an elected member of the Board of Directors of the IAOM and is the hygiene liaison. Joy is also a former associate professor at Indiana University School of Dentistry and an on-going guest lecturer at USC and UCLA to ortho, peri and pedo dental residents, and at CerriRos College to hygiene students.
