Arguments for providing loupes for dental hygienists

The primary arguments for why a dental hygienist should use loupes are essentially the same as why the dentist should use loupes.

The use of a loupe forces a certain working distance and, therefore, posture.

Truth be told, a hygienist spends more time over a patient each day than a typical dentist. This means that posture and reduced eyestrain is even more important for the hygienist than the clinician.

The improved vision of the loupe does far more than make it easier for the hygienist to see.

Not only will hygienists be able to perform the cleanings more quickly, the quality of the cleanings will be considerably higher and they will be less likely to miss issues that should be brought to the dentist’s attention.

The economic argument for why the dentist should purchase high-quality loupes for his or her hygiene staff becomes clear.

The most common cause of disability claims for hygienists are neck, back, and eye strain. Every single day that a hygienist is out due to these kinds of repetitive injuries equates to a $3,000 loss of revenue for the practice.

You know how important photographs are to your practice, but you don’t know who to turn to for advice. PhotoMed understands your needs and can help you choose the right camera. We also include a support and loan equipment program for the life of the camera so you have someone to turn to if you have questions.

PhotoMed dental cameras feature the best digital camera equipment available. The Canon G11, Rebel XS and T2i are great choices.

Choosing a quality dental system for your practice doesn’t have to be difficult. Call the experts at PhotoMed and we’ll help you with all of your camera questions.

**Fight oral cancer!**

Prove to your patients just how committed you are to fighting this disease by signing up to be listed at www.oralcancerselfexam.com. This website was developed for consumers in order to show them how to do self-examinations for oral cancer.

Self-examination can help your patients to detect abnormalities or incipient oral cancer lesions early. Early detection in the fight against cancer is crucial and a primary benefit in encouraging your patients to engage in self-examinations.

Secondly, as dental patients become more familiar with their oral cavity, it will stimulate them to receive treatment much faster.

If dental professionals do not take the lead in the fight against oral cancer, who will? And in the eyes of our patients, they likely would not expect anyone else to do so — would you?
