Disconnection and reconnection of the abutment disrupts the biologic zone, inducing the junctional epithelium to migrate apically beyond the implant-abutment junction until it can adhere again. This often results in marginal bone loss, particularly in cases of thin gingival biotype.

It is important to minimize the bacterial contamination in and around the implant-abutment junction. The seal provided by an abutment of locking-tapered design has been demonstrated to be optimal in this respect, in vitro (Dibart et al, 2005).

Implant abutments of gold or glazed ceramic should be avoided. Only titanium or zirconium abutments are recommended because hemidesmosomes have been shown to attach to them (Touati and Guez, 2002).

In order to retain soft and hard tissue around the implant/-abutment connection, the transmucosal aspect of the implant abutment should not be oversized and divergent, but rather narrow and concave in order to induce thickening and immobilization of the peri-implant tissues, thus increasing the interface between the implant and the soft tissue, and creating an “O-ring connective tissue”. This will ensure the long-term stability of the biologic width (Rompen et al, 2007).

Beneath the restoration, the concave abutment should provide maximum space to the soft tissue and clearly avoid a flared geometry. Its submerged profile should be negative to avoid compression of and to allow maximum thickness and stability of the soft tissue, as well as more room for the biologic width (Touati 2004). On the buccal aspect, the emergence profile of both the provisional and the final restorations should be flat or concave (under-contoured), to minimize pressure-induced apical migration of the gingival margin.

Design of final crowns to comply with the following “norms” will go a long way toward optimising papillary form (Salama et al., 1999; Elian et al., 2002):

- Distance from interdental bony crest to contact point between natural crown and implant-borne crown: 4.5 mm
- Distance from inter-implant bony crest to contact point between two implant-borne crowns: 5.8 mm
- Distance between bony crest and connection point between an implant-borne crown and a pontic: 5.5 mm

7) Occlusal trauma
It has been proven that an excessive occlusal load during

**Astra Tech Courses:**
**Reserve your place now**

**Surgical Anatomy Dissection and Introductory Surgical Implant Dentistry Course – A Hands On Cadaver Course**
- **Venue:** Royal College of Surgeons
- **London:** 28-29 July 2008
- **Course Tutor:** Dr Michael Norton BDS, Professor Vishy Mahadevan PhD FRCS(Ed) FRCS, Professor Chummy S Sinnatamby FRCS
- **Cost:** £1950 plus VAT

**Modular Implant Course, Birmingham – Surgical & Restorative Modular Course**
- **Venue:** Birmingham Periodontal & Implant Centre
- **Course Tutor:** Dr Boota S Ubhi, Dr Tuss Tambra
- **Cost:** £5,500 + VAT
  - Module One: 16th & 17th May
  - Module Two: 27th & 28th June
  - Module Three: 11th & 12th July
  - Module Four: 19th & 20th September
  - Module Five: 17th & 18th October

**Dental Implants - An Oral Surgeons perspective**
- **Venue:** The Royal Shrewsbury Hospital and Oracle Dental Clinic
- **Shrewsbury:** 16-20 June
- **Course Tutor:** Stephen Garner BDS (U.Lon) FDS RCS (Eng) DPS (Birm). Registered Specialist in Oral Surgery
- **Cost:** £2800 (includes lunch and refreshments)

**Surgical Anatomy Dissection and Advanced Bone Grafting Course – A Hands On Cadaver Course**
- **Venue:** Royal College of Surgeons
- **London:** 30 June & 1 July or 22-23 Sept
- **Course Tutors:** Dr Michael Norton BDS, Professor Vishy Mahadevan PhD FRCS(Ed) FRCS
- **Cost:** £1950 plus VAT

**Introduction to Implant Restorative Dentistry**
- **Venue:** Astra Tech HQ, Stonehouse, Glos.
- **London:** 19-20 June, 11-12 September
- **Course Tutors:** Dr Tussavir Tambra BDS, DDS, MS (Michigan). Specialist in Prosthodontics, Birmingham Periodontal & Implant Centre, Birmingham, United Kingdom.
- **Cost:** £400 + VAT
