New Picasso laser launched by Velpex

The Picasso laser contains two lasers: a 7 Watt (user power) Gallium Aluminium Arsenide (GaAlAs) diode laser and a small laser: the GaAs laser. The GaAlAs laser is ideal for soft tissue (gum) work – as it does not interact with haemoglobin. It is primarily used for the treatment of periodontal diseases, to build up, amalgam repair and the cementing of pins in root canals treatment.

DIAMOND CARVE

Diamond Carve is designed for Class 1 and Class 2 restorations together with class 3 and 4 restorations. It is used to prepare the restorations in dentine, to strip dentine, to strip enamel, to strip bone, to build up, amalgam repair and the cementing of pins in root canals treatment. It is available in 4 packs. The Diamond Carve is a practical package consisting of all the necessary items that will allow you to provide the best possible treatment for the patient.
