Most of us would jump at the chance to improve our dental practice free of charge if we were given the chance. This is, of course, unlikely to happen unless we win a competition or someone just hands us the money. In reality, it’s a totally different story. Making improvements to surgery costs a lot, so a large sum of capital will be required, and is usually borrowed at a cost that might haunt you in the future.

The hidden costs
Change rarely happens easily and the stresses brought to bear on you and your staff are not insubstantial. Few people deal readily with building work going on around them. The alternative to closing your surgery while building work is carried out merely adds to the cost. There is also the risk that the end result falls short of the standard you envisaged. There may be technical hurdles that are difficult to correct. Your new equipment might look sensational at the trade show or showroom, but not so good in your new environment. Designs that look clever on paper might be dysfunctional in practice.

Most dispiriting of all, is that your patients might revisit rather than approve of the changes. They might see it as a cost they’ll have to bear and when you come to sell your surgery, it may be difficult to recoup your investment. These are the downside factors against change.

Creating a space
There are few professions more confining or restrictive in a physical sense than dentistry. Most dentists spend eight hours a day, five days a week, in a cell. Why then would you not want that cell to be as perfect as you can make it, with design, equipment, lighting, air exchange and general ambiance all functionally and aesthetically optimal? Why would you want to subject your back and neck, eyes and ears to more strain than is necessary?

A question of pride
What about your self-esteem? And that of your employees? How do you feel your patients feel about your place of work? A place to be tolerated (or worse, endured), or one to be praised at Saturday night dinner? Your surgery and reception room are your shopfront, your ‘come hither’ showpiece, an essential part of your extended being. To be seen as less than excellent is to be less than excellent, and you pay a price for that, perhaps greater than the price you would pay to be seen as the best. There is a very simple test: how do you feel when you walk to and through your front door? Is the answer anything less than ‘great’, you are selling yourself and your profession short. That aforementioned cell will be no more welcoming than a prison cell, and you will feel just as imprisoned.

On the other hand, walking into a newly-created or refurbished, functionally designed, state-of-the-art practice can lift your spirits, improve your output, increase your earnings, protect your body, reduce your staff turnover and please your patients. Which of those would you not wish to have, whatever the cost?

What message does all of the above (and many other pro-

Consider the following list of time wasters in practice:
1. Failed and cancelled appointments
2. Having to redo dental work through poor technique by self and/or dental technician; greasing up or re-cementing provisional restorations
3. Misplacing laboratory work; mistreating x-rays and files
4. Defective equipment breakdown during clinical procedures by suction or rinsing
5. Being interrupted during clinical procedures by phone-calls etc; having to de-glove/ re-glove, during clinical procedures
6. Spending more time than necessary striving for perfection when good is good enough.

Each of these statements would contribute to inefficiency, together, to frustration, loss of earnings, annoyed patients, and poor interpersonal relationships. Just think who gets stressed when you run 15 minutes late: your patient; the next patient in the waiting room; your nurse, your receptionist, and not least, you! Time management is a necessary skill to be learned and applied, and begins with a considered and systematic analysis of one’s daily activities. That said, it is worth employing someone to sit in your surgery with a stop-watch and note-pad and observe and measure your daily routine.

However, this is only a starting point, for what you will be quantifying is the percentagericacy of your time you are using inefficiently. Stephen Covey defines ‘efficiency’ as getting more done in less time. However, doing more is not necessarily doing better. To do better
