The case for... and against Anger

Can an anger actually be beneficial to anyone? Surely not. Think about the way angry people behave: they are impa- tient; they get frustrated in queues or when being held on the phone; they are intolerant of others’ opinions; they mutter to themselves, or they raise their voices, often to the level of shouting; they are easily wound up; they take a swipe at or wound up; they take a swipe at or

The consequences

Can the consequences of such behaviour be beneficial? Again surely not. High blood pressure, stress headaches and stomach disorders (some even believe anger is a potent cause of cancer); conflict with one’s friends, colleagues and family; lack of concentration; the possibility of causing injury or even death. Ultimately, this leads to loss of respect from others and certainly from oneself; feelings of inability to cope, depression; alcoholism; loss of jobs or businesses—none of these can be desirable.

What are the signs of uncontrolled or undissipated anger? Making first small then big mistakes; dropping the ball; being excessively argumentative; burning food while cooking; forgetfulness; change in eating patterns (eating too much or too little); tiredness; inability to complete tasks; yelling at people who keep you waiting when on the phone or in line; having a “blame figure”—one particular person who seems to be responsible whenever something goes wrong.

The up-side

Yet, believe it or not, anger can have a positive side. Scientists at Harvard University even believe it can have a beneficial effect on your career. They found that people who vented their feelings rather than suppressing them were less likely to feel trapped under a glass ceiling. According to an article in the Guardian by Professor George Vaillant, lead scientist of the study, ‘Individuals who learn how to express their anger while avoiding the explosive and self-destructive consequences of unbridled fury have achieved something incredibly powerful in terms of overall emotional growth and mental health’. Venting the pressure-cooker

According to Guardian journalist Julian Baggini, at work (or at home), the individual who is completely emotionally repressed and suppressed is often more difficult to deal with than its volcanic counterpart. When one consistently tries to cool down hot emotion and leave it unstated and unresolved, the emotion can get lost, leaving behind a cold-blooded “heartless automatism”. Emotions are neither good nor bad—what matters is how — and when — we deal with them. Better to deal with a relatively minor irritant properly by venting it at an early stage rather than store it and magnify it and let it loose later when you finally explode. A one-minute loosing of feelings will tend to be forgotten quite quickly, whereas a 50-minute tirade may take days to be forgiven and is rarely forgotten.

The European way

Think about the way we think of continental Europeans: hot-blooded ultra-passionistas who shout at rather than talk to each other. Yet they are less likely to get into a fight or get drunk than we reserved British.

Anger should be seen as a justified response to wrong-doing, but it should be proportionate. It should also be focused on the issue rather than on the person. It cannot be stated that uncontrolled anger is beneficial, but controlled low-level anger can be a useful and proper way to vent one’s feelings before they collect up and finally explode.

Are you for or against the argument that anger can be beneficial? Email jury@dentaltribuneuk.com and share your thoughts

Instant Gratification for Denture Patients

Do Your Patients have denture problems?

IMTEC – world leader in Mini Dental Implants

Implant threads designed for different bone types

Simple protocols and a cost effective solution for denture stabilisation

IMTEC Mini Dental Implant System

IMTEC's Sandax MDI® Implant System offers a revolutionary one-hour, one-stage solution for long-term denture stabilization. This immediate loading mini dental implant system utilises a patented, fastass placement protocol and works with the patient’s existing denture. The versatile MDI implant family includes the 1.8 and 2.1mm implants with standard thread design and the 2.4mm MAX thread for softer bone.

MDI Hybrid Implant

2.9mm Implant System

One day Seminar: 6 or CPD – Cover implant theory, patient selection, clinical protocols and instrumentation for MDI placement.

One and a half day Surgical hands on Seminar: The CPD – Friday pm – theoretical aspects of MDI placement and planning. Saturday all day – Hands-on live surgery and the opportunity for you to place implants, under supervision, either in a patient you bring along or a volunteer, £695.00

Smile Design dental Practice in Nantwich, Cheshire. July 3-4 and Nov 13-14. More may be available
