Pedonomics: lasers in paediatric dentistry

By Dr Immeet Madan, UAE

We live in an era in which time is the basis for many decisions: what saves time is what gets chosen. Introducing better technology helps to work with time economics in paediatric dentistry. The recent term coined for this perspective of expanded thinking is “Pedonomics.” Pedonomics refers to the impact of the changing world of paediatric dentistry in the dental practice.1

Time economics goes hand in hand with pedonomics. The selective niches of dentistry are expanding far more today than in the past years. Few reasons that account for the need of this level of advanced healthcare are:

1. Some parents who have their children later in life are referred to as drone parents. These parents self-educate a lot via social networks and extensive internet research. With less inherent trust in healthcare providers, they generally form a strong opinion about the dental care of their children and are most demanding of their paediatric dentist.
2. This category of parents are often tech-savvy and are quite updated with latest technologies. They appreciate a “no pain, no drill, no memory” dentistry.
3. Caries rate in dentistry is ever-increasing, with a heightened frequency of cariogenic diet and a decline in caries prevention.
4. There are more and more general dentists that would “do the job” and only if it is mismanaged, would they refer the child to the specialist. Increased availability of advanced technology can put an end to this trial practice.

Lasers as game changers

Lasers are introduced as excellent instruments in everyday dentistry. However, the idea of dentistry is generally connected to discomfort and pain in children’s minds. Any treatment trend that can help out practice to overcome this connection by the use of contemporary technologies can increase patient referrals and treatment acceptance.

Although the hand piece does remove the dental decay, it may also cause abrasion of the tooth structure and a significant amount of discomfort that may not be taken very well by the children. In addition, the vibration and noise of the drill could be unpleasant to young ears, thereby lasers can prove a better tool as they do overcome all these fears of drill dentistry.2 Additional benefits must far supersede the costs and investments when it comes to completing the laser requirements of any practice.

Marketing protocols help us to see a larger number of patients per day, but to have these patients accept the proposed treatments better, it is advisable to introduce them tools that can truly help. As applicable in any field, an experience that exceeds the expectations will motivate the patients to keep appointments, accept recommended care and hence allow to build up positive clientele.

Laser indications in dentistry

Medicine began to integrate lasers in the mid-1970s for soft tissue procedures. The first laser specifically for dental use was a neodymium-doped yttrium aluminum garnet developed in 1978 and approved by the Food and Drug Administration in 1990.5

Benefits

• Less thermal necrosis of adjacent tissues is produced with lasers than with electrosurgical instruments.1–5
• Haemostasis can be obtained without the need for sutures in most cases.1,19
• Little or no local anaesthesia is required for most soft tissue treatments.16
• Reduced operator chair time has been observed when soft tissue procedures have been completed using lasers.
• Lasers feature decontaminating and bactericidal properties on tissues, requiring less prescriptions of antibiotics post operatively.5,16
• Lasers provide relief from pain and inflammation associated with aphthous ulcers and herpetic lesions without pharmacological intervention.5

Lasers allow the dental practice to balance well between business and dental care. Offices that in corporate lasers in their practice have a unique psychological and promotional advantage over those who fail short to offer such services. Lasers are definitely the foundation of creating a referral-based practice.20

Benefits that add to the practice are always important, but how actually does one convince oneself to accept the resulting expenses for the practice. Usually, lasers are considered high investment and any high investment must prove reasonable enough to be accommodated in the practice. Return on investments with lasers can be easily pre-calculated. In general, laser treatments can cost 35 to 40 per cent more than the usual appliance, this calculation done for a return period of two to three years can yield on the investment.

Mathematics in pedonomics

The introduction of lasers into the practice should be made in an orderly and precalculated manner. Proper financial planning will help ensure the successful introduction of laser and help to yield its benefits better. Calculation of economics used in paediatric dentistry and thus making decisions in favour of economic benefits to the practice are the basis of pedonomics. The concept of pedonomics and the time-economics model are based upon the profitability per unit of chair time which is the most important factor in determining the financial future of the practice. Pedonomics work on the presumption that the profit matters, not the income.9

Laser costs

Cost is the primary determinant in any acquisition. In the most common manner, it is defined as the amount of money paid or charged for something. It is termed as price in the economic language. Another important factor here is the opportunity cost. It is the added cost of using resources (as for production or speculative investment) forms the difference between the actual value resulting of using this opportunity and that of its alternative.

Opportunity costs is a major determinant as it describes the following:

2. Costs incurred when not having the laser, which include: loss of
income due to loss of high-end, cutting edge dentistry, loss of referrals.

The final decision to purchase is worked out after looking at both financial and the opportunity costs."}\n
Laser as a profit centre

There are many ways that can help us calculate the profits based on Laser procedures. In any private practice, time is money. This can be best determined on the basis of the average hourly income. There should be a certain specific amount that needs to be earned per hour that can keep the practice flourishing. Apart from this basic income, any additional ability to perform the procedure more efficiently means extra income. The average amount of one hour chair time should be able to yield approximately 700 to 750 US Dollars. This is not the fixed amount but an approximate average that can keep the practice on profitable ends.

The procedures that can be effectively and efficiently performed by using laser in the paediatric dental office are:

1. Restorative laser dentistry
2. Laser-assisted endodontics
3. Frenectomy
4. Sealants
5. Minor surgical procedures
6. Tooth desensitisation
7. Lingual fraenum removal
8. Exposure of unerupted teeth
9. Laser tooth whitening
10. Treatment of orthodontic or drug-induced hypertrophy.

Return on Investment*\n
Once the laser is bought, pedonomics suggests that there should be a fair return on the investment made. Just to break even, the income generated by laser must include covering the price of the laser, maintenance, supplies as well as an additional amount to cover the income lost from the money used to purchase the equipment and not otherwise generating its own income. The profit that exceeds the break-even point is called the return on investment (ROI).

Some of the items that should be included in ROI would entail the profit from the following:

1. Noveltiy of procedures with lasers.
2. Reduced out referrals, caused by the new laser procedures.
3. In-referrals due to the uniqueness of laser-assisted paediatric dentistry.

Tracking

To actually calculate the accurate financial return of introducing the laser to the practice, the

1. Novelty of procedures with laser will entail the preposition due to the novelty costs. 16
2. In-referrals due to the uniqueness of laser procedures.
3. New patients that come asking for laser.

If KPIs seem to increase or even remain at a good level, this indicates that break even and the much awaited ROI will not be far off.

Unique selling proposition

The USP is the unique cutting edge of any practice. When it comes to paediatric dentistry, lasers are indeed a unique selling proposition due to their contemporary benefits. In the field of marketing and management, USP is defined as the factor or consideration presented by a seller as the reason that the product or service is different from and better than that of the competition. The USP of lasers are as follows:

- Decreased out referrals.
- Less need for anaesthesia.
- No pressure on or contact with the tooth.
- Easier healing.
- Easier instrumentation.

Six Sigma approach of pedonomics

Six Sigma is defined as the set of techniques and tools for process improvement. It was introduced in 1986 by Motorola. It was developed by W. Edwards Deming and later expanded by Joseph M. Juran and Philip B. Crosby. The Six Sigma approach is a structured, disciplined, data-driven methodology for improving the performance of business processes.

Why exhibit at SCANDEFA?

SCANDEFA is a leading, professional branding and sales platform for the dental industry.

In 2017 we are pleased to present SCANDEFA with two fair days and a more flexible course programme at the Annual Meeting. In addition to sales, branding and customer care, the fair format gives you the opportunity for networking, staff care, professional inspiration and competence development. SCANDEFA is organised by Bella Center Copenhagen and held in collaboration with the Annual Meeting organised by the Danish Dental Association (tandlaegeforeningen.dk).

How to exhibit

Please book online at scandefa.dk or contact Sales & Relation Manager Mia Clement Rosenvinge mro@bellacenter.dk/+45 32 47 21 33.

Who visits SCANDEFA?

In 2016 over 8,000 dentists, dental hygienists, dental assistants and dental technicians visited SCANDEFA.

For further statistical information please see scandefa.dk

Where to stay during SCANDEFA?

Two busy fair days require a lot of energy, and therefore a good night’s sleep and a delicious breakfast are a must. We offer all of our exhibitors a special price for our three hotels, AC Hotel Bella Sky Copenhagen – Scandinavia’s largest design hotel, Hotel Crowne Plaza – one of the leading sustainable hotels in Denmark and 5* Copenhagen Marriott Hotel.

We also offer easy shuttle service transport between the airport, Hotel Crowne Plaza and AC Hotel Bella Sky Copenhagen.

SCANDEFA invites you to exclusively meet the Scandinavian dental market and sales partners in wonderful Copenhagen.
A Six Sigma process is one in which 99.99966 per cent of all opportunities to produce some feature of a part are statistically expected to be free of defects (3.4 defective features per million opportunities). When applied to medical or healthcare systems, the most important dimensions of the quality of the medical act are:

- Safety
- Professional competence
- Acceptability

The approximate amounts ranging in our practice which runs its costs parallel to the costs in the United States can be seen from Table 1 and 2 and the following numbers:

- The average amount spent on purchasing as laser: 350,000 AED.
- Equated monthly instalments calculated with interest: the purchase of laser was made with complete down payment.
- Average cost per month over three years period: 10,000 AED.
- Average increase in treatments with laser vs conventional approach: about 200 per type of treatment:
  - Fillings: approx. 300 more with laser than Conventional way; average 45 per month.
  - Pulpectomy: only lasers. Average 30 per month.
  - Laser frenaectomy: 2 per month.
  - Laser pulpotomy: 15 per month.

Based on the above numbers, the approximate profit earned on laser vs. conventional approach:

- Fillings: 30 x 300: 9,000 AED.
- Pulpectomy: 30 x 300: 9,000 AED.
- Frenaectomy: 500 AED.
- Seals: 20 x 300: 6,000 AED.
- Laser pulpotomy: 15 x 300: 4,500 AED.

Based on the above figures, the average amount gained from laser approach of treatment: 41,000 AED.

- Net profit: 41,000 to 10,000 (monthly investment on laser over three years period) = 31,000 AED per month.

Break even was tentatively achieved at the end of 14 months. Profit started roughly after this period.

Conclusion

The Six Sigma approach with lasers teaches us to apply the zero-defects principal. This degree of excellence is not just in a word, but there is a realistic possibility of making it happen. It is an approach that can actually accelerate the rhythm of development and of the distribution of new ideas within an organisation. Laser is a tool that helps in the application of the Six Sigma principle in the dental office. In conclusion, it is statistically proven that laser with all its attributes is quite efficient in bringing “more dentistry” to a dental office.
