We are all well aware of the ongoing controversies around dental bleaching and whitening, but at the time of writing, it would seem that the government is pushing for clarification from the European Parliament, which should make it easier for uniform regulation and control over who is permitted to carry out such procedures.

However, there is no denying that an increasing number of patients are undergoing elective procedures to improve their smiles and accordingly, dentists have updated their skills to meet the demand and now offer porcelain veneers and bleaching treatments. Sadly, there has been far from a happy ending to discoloured or irregular teeth; I have noticed a rise in the number of patients presenting with acute sensitivity and pain following these procedures.

Understandably, patients are often angered and upset that their once imperfect, but intact teeth are hurting and this reinforces the vital importance of informing a patient of any possible problems prior to treatment, and of course, taking steps to avoid problems during preparation.

Diagnosis and consent is the starting point and the patient should always be warned that they are undergoing an elective procedure; any procedure involving the preparation of a tooth can cause inflammation but if all goes well this will be temporary discomfort and should settle by itself. Radiographs and models should be taken to assess tooth position and preparation with regards to proximity to the pulp.

‘Diagnosis and consent is the starting point and the patient should always be warned that they are undergoing an elective procedure’
What's Missing?

Three global titles from the Dental Tribune International portfolio are coming to the UK. Published quarterly, each of these glossy, clinically-focussed titles aims to bring you the latest developments in the fields of implantology, endodontics and cosmetic dentistry in a clear, easy to read format.

What's missing?

implants

Fill the gaps... implants, the international magazine of oral implantology, delivers the latest thinking in this fast-moving area of the dental profession. User-oriented case studies, scientific reports, meetings, news and reports, as well as summarised product information, make up an informative read.

You got the look...

cosmetic dentistry

You got the look... cosmetic dentistry - beauty & science presents the most significant international developments in the world of cosmetic and restorative dentistry. With an editorial mix of speciality articles, clinical studies, case reports, industry reports, reviews, news, and lifestyle articles, cosmetic dentistry leads the way.

Enjoy Endodontics?

roots

Down your canal... roots is the place to keep up with the latest developments in the endodontic arena. A combination of comment, studies, case reports, industry news, reviews, and news, those professionals with an interest in endodontics will find roots invaluable.

Ideally, if teeth are poorly aligned, then both orthodontic and endodontic options should be discussed. In fact, many leading cosmetic practices now have close relationships with orthodontists, which makes perfect sense as aligning teeth makes the veneers easier to place and gives a superior cosmetic result. However, should the patient decline orthodontics, elective endodontics may be essential so that the tooth can be further reduced and realigned without compromising aesthetics or leading to inadvertent pulpal problems.

Once a patient has agreed to veneers it is worth remembering what the worst things are that we can do to teeth:

- Take a perfect tooth, and then remove all the enamel with a high-speed bur. If the bur is blunt or there is not enough water, the tooth will heat up dramatically causing severe pulpal inflammation and possible pulp death. Always use brand new burs and plenty of water which will keep all the teeth moist and cool
- If there are multiple preps being done at the same time, the first teeth can desiccate. Moist gauze can be placed over the preparations
- Avoid over preparation of teeth. The best preps are in enamel and this ensures a better bond. Trial preps on a model, following the methods used by Dr Gurel, will ensure minimal but adequate preparation
- Temporaries tend to be spot welded to ensure easy removal, but may also lead to bacterial leakage which can cause real sensitivity and pain, particularly if the tooth has already been traumatised by the preparation. The bacteria can penetrate the freshly opened dentinal tubules in the heavily prepared areas, especially if there is a good shoulder preparation at the neck of a tooth. Therefore, good, well-fitting, temporary veneers are essential, as is protecting the teeth before the impressions are taken. A fourth generation dentin bond like Optibond SL by Kerr, will help seal the tubules, cutting down on the potential for leakage.

Then comes the problem of actually fitting the veneers. Taking off temporaries and etching a tooth can exacerbate an already sensitive tooth and can be excruciating, but if the tooth has been well protected beforehand this should not be a problem.

It is inevitable that teeth will be sensitive to cold stimuli following a procedure and this should be closely monitored. Often the patient guides us and when teeth do not settle, a decision has to be made to denervate a tooth, and general well-being; however, they and their dentist need to be absolutely clear that this is a very complex restoration that must be done with great care so that healthy teeth do not need to be root treated later.

Once a patient has agreed to veneers it is worth remembering what the worst things are that we can do to teeth

There is no doubt that veneers can give a beautiful result and enhance a patient’s self-confidence and general well-being; however, they and their dentist need to be absolutely clear that this is a very complex restoration that must be done with great care so that healthy teeth do not need to be root treated later.
