Implants featured at Chicago Midwinter

Hundreds of companies, including a bevy of implant companies, headed to the Chicago Midwinter Meeting to present the latest and greatest in products and technology. Nearly 30,000 dentists, hygienists, dental students and others attended the 148th annual meeting, presented by the Chicago Dental Society, at the McCormick Place West Building in Chicago. The next Chicago Midwinter Meeting will take place Feb. 20-22, 2014. Mark your calendars now! For more photos, see page B8.

Annual February show is a must for launching new products in the dental implant industry

Using SonicPin Rx

Dissolving the need for metal fixation screws in implant site development

By Lewis Cummings, DDS, MS

In this ever evolving age of dental technology, the practice area of implant site development has benefited from a technologic innovation and a new era of resorbable fixation devices and membranes. Traditionally, various metal fixation screws have been utilized for stabilization with the primary drawback being the need for eventual reentry for removal. Now, the necessitation of fixation device removal has been eliminated with the introduction of the SonicWeld Rx™ system of resorbable fixation devices and membranes. A 42-year-old male presented with a significant buccal osseous defect resulting from the long-standing loss of the maxillary right first premolar (Fig. 1). A single tooth implant-supported restoration was planned. See SONICPIN, page B2
as the final prosthesis. Given the volume of bone loss in the first premolar site and the desire to minimize post-operative morbidity, an allogenic block bone graft was chosen for defect regeneration.

Though the predictability of allogenic block graft material is well-documented, complete graft immobilization is imperative for success.1

The SonicWeld Rx process of onlay block graft fixation utilizes an ultrasonic vibrating handpiece to deliver a polymer pin through the graft and into the host bone. The SonicPin Rx travels into a specially prepared hole with variable diameters, similar to a lag method. The SonicPin Rx is designed to engage a minimum of 5 mm of host bone at its tip. The final length determination of the pin is an addition of this length plus the graft thickness. Given this consideration, the typical SonicPin Rx clinical length is 9 or 11 mm and the diameter is 2.1 mm (Fig. 3). For bone fixation, a specially designed drill is utilized to prepare an insertion site through the onlay graft and into the host bone.

The SonicPin Rx is then loaded onto the sonic handpiece tip and inserted into the preparation without sonic activation. The pin should advance passively through the graft portion until engaging host bone at the distal aspect of the preparation. This distal portion has a special geometry allowing the tip of the pin to be seated snugly prior to activation of the welder. Once seated, forward orthogonal pressure is placed on the SonicPin Rx and the SonicWelder is activated, initiating sonic vibrations that travel down the shaft of the pin, ultimately creating friction heat against the bone at the site of bone-pin contact. The user translates a consistent level of energy with steady forward pressure.

3D imaging **for lower dose**

than a 2D panoramic*

is not magic...

...it’s i-CAT®

The new i-CAT FLX is a reality!

This latest advancement of our award-winning technology offers a range of innovative features that deliver increased clarity, ease-of-use, and control. Now with visual IQality™ and QuickScan™ technologies, the power of capturing diagnostic 3D images at a lower dose than in 2D panoramic exams is in your hands.

Schedule a demo today! Call 1-800-205-3570 or visit www.i-CAT.com

Introducing CAD Milled Bars & Abutments

Select from a wide range of bars and abutments for implant Direct's popular industry-compatible implant interfaces below. Custom Direct bars are also available for implant Direct and Nobel Biocare multi-unit, screw-receiving abutments as well as implant Direct's proprietary 1-piece ScrewDirect implant. Custom Direct abutments may be fabricated in titanium or one of five different zirconia shades for optimal function and aesthetics.

CustomDirect™ bars made using the industry's only robotic and full automation machining centers for unprecedented precision and efficiency. Select bar design and order online at www.custom-direct.com

forward pressure on the handpiece before and during the activation. Within moments of activation, the outer surface of the SonicPin Rx liquefies, leading to a narrowing of the shaft that allows for subsequent insertion into the full depth of the pilot hole. Ultimately, the larger head of the SonicPin Rx partially inserts into the narrower proximal hole, forcing polymer into this external bony wall as well. Once fully seated, the SonicWelder is deactivated and removed from the pin after a brief cooling period.

The SonicWeld Rx process is based on the effect of vibratory frictional heat on the thermoplastic polymer shaft of the SonicPin Rx, leading to pin liquefaction. This transformation allows for the subsequent engagement of the liquefying pin into the ever-narrowing recipient preparation. A minimal elevation in temperature is created, but only for very short periods of time where the two hard surfaces are in contact. Though the friction of the ultrasonic vibration translated to the SonicPin Rx

ATLANTIS™

Abutments as individual as your patients

Available for all major implant systems and in your choice of titanium, gold-shaded titanium and multiple shades of zirconia, ATLANTIS™ patient-specific. CAD/CAM abutments help to eliminate the need for inventory management of stock components and simplify the restorative procedure.

ATLANTIS BioDesign Matrix™
The four features of the ATLANTIS BioDesign Matrix™ work together to support soft tissue management for ideal functional and aesthetic results. This is the true value of ATLANTIS™ for you and your patients.

ATLANTIS VAD™
Designed from the first tooth shape.

Natural Shape™
Shape and emergence profile based on individual patient anatomy.

Soft Tissue Adapt™
Control support for soft tissue sculpturing and adaptation to the finished crown.

Custom Connect™
Strong and stable fit – customized connection for all major implant systems.

Find out how ATLANTIS™ can bring simplicity and aesthetics to your practice. Just take an implant-level impression, send it to your laboratory and ask for ATLANTIS today.

is adequate to melt the outer polymeric core, histologic evaluation has shown no damage to the receiving bony structures. For this case, local anesthetic was administered and removal of the temporary prosthesis was performed to allow access to the site through a traditional full-thickness mucoperiosteal flap on the buccal. Using rotary instruments, an aggressive slot preparation was created in the deficient first premolar site for re-entry as the fixation pins did not have to be removed. An implant osteotomy was prepared to receive a 3.8 x 12 mm BioHorizons Tapered Internal Hex Implant with the Laser-Lok surface (Fig. 10). Following insertion, the cover screw was placed, the site was closed with absorbable suture, and the temporary restoration was replaced.

An additional four months to allow for proper implant integration, the healing abutment was placed, and the final restoration was fabricated. The SonicPine Rx system was chosen for fixation in the case to eliminate the need for a subsequent site reentry for screw retrieval. It stays strong while the bone heals, then it loses strength and resorbs, which results in less risk and more benefit for both the patient and the dentist.
