Avex CXi

Made from polycrystalline alumina, Avex CXi Ceramic Brackets offer trans- lucence without sacrificing bracket integrity, bond strength or patient comfort. Bracket features include mesial and distal “pockets” that provide greater inter-bracket distance, reducing wire forces and improving patient comfort; metal slot liners to enhance strength and reduce friction; and purchase points on the tie wires that have a patented shape that is both round for comfort and pointed for easy ligation.

The universal color identification marking and the same in/ out dimensions for each tooth as the Avex MX Stainless Steel Brackets, make the brackets completely interchangeable — an industry first.
