The Quick Fix device for pseudo-Class III

Resolving anterior crossbites with the Quick Fix device

By S. Jay Bowman, DMD, MSD
(This is Part 2 of a two-part series)

The Quick Fix device is based on a typical 2 x 4 edgewise appliance and was designed to provide effective and efficient advancement of the maxillary incisors. The appliance consists of a rectangular stainless-steel arch wire, open coil springs, arch locks and Side Swipe auxiliaries.

Installation of the Quick Fix
Correction of a pseudo-Class III malocclusion in the transitional dentition is initiated by placement of an upper 2 x 4 appliance (e.g., two banded or bonded first molar tubes and pre-adjusted Butterfly Bracket** brackets on the central and lateral incisors).

LEVELING AND ALIGNMENT OF INCISORS
Extra fine round superelastic wire typically requires two to five months before placing the rectangular wire of the Quick Fix device.

Next, Side Swipe auxiliaries are inserted into the molar tubes and may be tied back (Fig. 5). The Side Swipe will permit an additional arch wire length of 4–5 mm without that marks on the right and left side of a .0175-inch x .025-inch stainless-steel arch (Fig. 6).
We are who we choose to be

By Dennis J. Tartakow, DMD, MEd, EdD, Editor in Chief

W ith the 21st Century well into its second decade, new scientific technology, industrial integration and greater knowledge and skills are essential in order to move forward. Even with all elements and factors already in place, IT and administrative staff members, faculty members and orthodontic educators must develop new skills as technology advances.

For those individuals who are in, or have moved into, new careers in education, it is never without need for change, modification, training or learning new job skills. Career changes, such as from clinician to educator, must include reflection and reconsideration of attitudes and behaviors.

It’s a new ball game with new rules, policies and conditions. We must glean greater understanding in order to assess the requirements and develop a plan for greater educational growth. This requires a strategic development plan that includes many essential factors, i.e. critical decisions for future growth, expansion of institutions, supportive companies, etc.

The “renaissance orthodontists” involved might greater thought and consideration to experience future success in such a career change. In the educational milieu, this strategic development plan might serve as a tool for (a) exploration of goals, (b) determination of skill levels requiring different faculty expertise and (c) appreciation of faculty needs that have exploded since in the computer age commenced.

Setting direction and planning are two separated activities. A necessary function of leadership is to produce change and set a new direction of that change. We must devote time and interest to such a strategic plan in order to (a) syn-chronize visions and aspirations, (b) provide a blueprint for a viable future to anticipate change and (c) hold constant the reason for being — the education of our students.

An assessment of strengths, weaknesses, opportunities and threats are also important in order to develop a strategic development plan. Such assessments could provide valuable reflections and analyses for yielding priorities that will be essential and critical for future success; such priorities will allow progression to the next or higher level.

Historically, reduced recruitment and retention and increased faculty vacancies have been becoming emergent problems in orthodontic education since the early 1990s, impacting people, communities and society. These issues have led to a daunting outlook for the future of orthodontic education.

“There is no doubt that dedicated orthodontic educators have been critical to the development of the specialty. The question is whether the faculty will be there in the future to continue this history of strong education” (Larson, 1998, p. 122). This is the essence of a force for change that is necessary in our specialty.

Our responsibilities as educators are to educate our students to be professional and the best orthodontists they can be; teach them how to be experts; prepare them to speak before groups of individuals or to address a judge and jury in the courtroom; and most important — impress upon them the importance to write precisely, accurately and legibly.

Writing is one of the most important methods of communicating our thoughts, especially regarding treatment plans and projected patient outcomes, which can make a big difference years later when we are asked to defend ourselves and we cannot even remember the patient’s name, let alone how we treated them.

Ask any malpractice attorney about how well orthodontists communicate his or her thoughts on a patient chart. Many do not write adequate notes in his or her patient’s treatment chart to explain problems or elaborate treatment issues, and much writing is so poor that whatever is written makes little or no sense.

As educators, this is a poor reflection on us personally. Not only are most notations illegible, using short-cuts, abbreviations and hieroglyphics that are difficult to decipher, but most chart entries are way too short, incomplete and unacceptably inadequate. These are egregious situations and occur too often.

Orthodontic education is in need of fresh blood; this dilemma of full-time faculty member reduction resonates with inadequacies and consequences for today and tomorrow. Ultimately the financial obligation made it difficult, if not impossible, to attract young doctors to consider a career in postgraduate orthodontic education.

As a social justice concern, there may be a huge impact on the survival of the profession, especially the ability to serve the individual and address community needs. The price tag most likely may prohibit low-income students from pursuing the degree and also may have a negative impact on serving society as a whole.

As clinicians, researchers or educators must be responsible and accountable for helping our present and future residents benefit from our armamentarium of skills, proficiency and expertise. Whether it be through the Socratic method, a form of inquiry and debate between individuals possibly with opposing viewpoints based on asking and answering questions to stimulate
Are kids taking unnecessary risks?

In a matter of seconds, a sports injury can occur to the face or the mouth. Young children ages 5 to 14 are especially vulnerable, accounting for more than 80 percent of all sports-related emergency room visits, according to the Centers for Disease Control. Because many sports injuries can be prevented by wearing the proper protective gear, why aren’t more parents, coaches and kids getting the message?

Each April during National Facial Protection Month, the American Association of Orthodontists urges athletes to “play it safe” by wearing mouth guards and other appropriate protective gear when participating in many sports and activities. According to a survey* taken by the AAO:

- 67 percent of parents surveyed said their child does not wear a mouth guard. 52 percent said that it was because their child “doesn’t need that level of protection.”
- 96 percent of parents surveyed believed their child’s coach’s role on the use/promotion of protective sports gear was “important,” “very important” or “extremely important,” yet parents surveyed reported that only 56 percent of coaches actually recommended mouth guards during competitions while 34 percent recommend them during practice.
- According to parents surveyed, the most popular sports that children wear mouth guards while playing include football (42 percent), ice hockey (32 percent) and martial arts (13 percent).
- Of the parents surveyed, the most popular form of protective sports gear for children participating in organized sports include shoes/cleats (67 percent), helmet/headgear (51 percent), shin guards (48 percent) and knee pads (54 percent).

Patients who play sports such as hockey should be encouraged to wear mouth guards. (Photo/stock.xchng)

The AAO recommends that mouth guards be worn for contact sports. Such sports include, but are not limited to, football, wrestling, basketball, baseball, volleyball, lacrosse, ice and field hockey, softball and soccer. Mouth guards also should be worn when participating in any activity where the mouth might come into contact with a hard object or the ground. Mouth guards can help prevent jaw, mouth and teeth injuries and are less costly than repairing an injury.

“I’ve seen too many children and adults ruin their healthy, beautiful smiles — or worse — because they fail to wear a mouth guard during practices and games,” says William Gaylord, DDS, MSD, orthodontist. “Precaution and common sense are key to preventing injuries.”

Mouth guards are one of the least expensive pieces of protective equipment available. An orthodontist can recommend the best mouth guard for an athlete who wears braces.

(* The AAO commissioned Impulse Research Corp. to conduct the AAO 2008 Protective Sports Gear Survey. The survey was conducted in February 2008 online with a random sample of 1,049 men and women, ages 18 years old or older, from the United States and Canada. Survey participants are representative of American and Canadian men and women 18 years old or older who have children between the ages of 8 and 18 who participate in organized sports.)

Critical thinking, or to simply illuminate ideas, these residents must carry the torch of learning that we were so blessed to have received from our mentors; the future of orthodontics depends on our efforts. Where is Socrates when he is needed the most?

Aristotle (384-322) articulated it quite well: “The educated differ from the uneducated as much as the living from the dead” (Howe, 2005, p. 19).

References
This position will permit seating of the arch wire into the incisor brackets with the arch locks distal to the lateral incisors. Sections of open coil spring are slid onto the wire, up to the arch locks. These parts are pre-assembled and stored in anticipation of their future use. Upon insertion of the Side Swipes, the arch wire of the Quick Fix assembly is inserted into the edgewise tubes of the Side Swipe, not in the molar or headgear tube (Fig. 5). The excess wire now lays adjacent to the molar tube.

The arch wire is then seated into the incisor bracket slots and a stainless-steel ligature is laced, e.g., “figure-8,” (Fig. 5) across to consolidate the incisors together so as to prevent opening space between the teeth. The arch locks are tightened with the wrench, and they are slid distally along the wire to compress the open coil spring (Fig. 7).

Once the locks are positioned between the first and second primary molar, compression is typically sufficient, and the locks are tightened. A distal end cutting pliers are used to cut the arch wire flush to the end of the molar tube, not the Side Swipe tube (Fig. 8).

This will leave about 4–5 mm of wire distal to the Side Swipe next to the molar tube to provide for advancement of the incisors; a process that requires about two to three months.

The Quick Fix device is self-limiting. In other words, should a patient not return within four to five weeks after installation, incisor advancement would only progress until the distal portion of the arch wire slips out of the Side Swipe tube (Fig. 5).

Simple case reports demonstrate the progression of treatment and correction of typical pseudo-Class III anterior crossbites using the Quick Fix device (Figs. 9–13). Other appliances and devices may be combined with the Quick Fix device such as palatal expanders, e.g., MIA Quad Helix, etc. (Fig. 15), reverse pull facemask, lower 2 x 4 and Class III elastics.

After the desired amount of advancement is achieved, the appliances may be removed and retention initiated as desired.

Class II correction with the Quick Fix device
Molar distalization: Class II elastics
If anchorage is applied to the Quick Fix mechanism to prevent “flaring” of the incisors, then distal movement of the molars can be achieved. Because this device is not inserted into a headgear tube (in contrast to the bimetric arch32), there is no cervical headgear. As described by Jumper33, fixed functional can be added.

Another alternative would be the application of Class II elastics to support the incisor position. This requires fixed appliances on the lower arch, e.g. 2 x 4 and fixed lingual arch. Unfortunately, both headgear and elastics wear are dependent upon unpredictable patient compliance.

In contrast to the Distal Jet36 (a device specifically designed for molar distalization), both the Quick Fix and bimetric produce force at the crown, rather than through a couple closer to the center of resistance of the molar. As a consequence, they produce more molar tipping and may introduce unwanted labial tipping of the lower incisors from elastic wear. The use of a pre-adjusted appliance with lingual crown torque in the brackets on the lower incisors may reduce that incisor “flaring.”38

Molar distalization: mini-screw supported
As an alternative distalization method for Class II patients, mini-screw anchorage can be added to provide indirect anchorage to the Quick Fix. Mini-screws can be inserted into the buccal alveolus, between the upper first molars and second premolars or in the infraocclusal ridge.32,35

Stainless-steel ligature is then tied from the mini-screws to the incisors to support the distal-driving force from the Quick Fix. An alternative microscrew insertion location would be on the palatal alveolus between the roots of the first molar and second molar36,37 with a steel ligature tied from the TAD to a button bonded on the lingual of the upper first premolar.

Once the molars have been overcorrected into a super-Class I (half-step Class III) relationship, then the mini-screws may need to be removed, and possibly re-positioned, if they are needed to provide anchorage support for retraction of the remaining maxillary teeth.
Conclusions

Ismail and Bader have suggested that, “In developing appropriate treatment plans, dentists should combine the patient’s treatment needs and preferences with the best available scientific evidence, in conjunction with the dentist’s clinical expertise.”

Early correction of pseudo-Class III malocclusion has been demonstrated to provide simple, rapid (about six to eight months), efficient, reliable and stable resolution of anterior crossbite. In addition, this treatment reduces the risk of development of skeletal Class III malocclusions and may diminish the difficulty of, or occasionally eliminate the need for, any later comprehensive treatment.

The Quick Fix device is a simple, predictable, and effective mechanism for achieving this correction for pseudo-Class IIIIs, and it can also be used for Class II patients to provide molar distalization using Class II elastic or mini-screw support.

Steps for inserting the Quick Fix Device

1. Placement of a maxillary 2 x 4 pre-adjusted appliance.
2. Initial alignment and leveling with .016 superelastic arch wire for two to five months.
3. Place appropriate right and left Side Swipes into the maxillary molar tubes: the segment of wire is inserted from the mesial into the molar tube with the Side Swipe tube positioned mesial and buccal to the molar tube.
4. Trim the excess wire of the Side Swipe just flush to the molar tube and tie back with an elastic or stainless-steel ligature tie (optional).
5. Place universal arch locks 36 mm apart (to fit distal to the maxillary lateral incisors) on a .0175-inch by .025-inch stainless-steel arch wire.
6. Slide two 20 mm open-coil springs on the arch wire up to each arch lock.

Figs. 10a–e: Anterior crossbite resolved in seven months with combination of upper 2 x 4 appliance and Quick Fix appliance for an 11 year old male. At age 13, the patient was ready for some limited treatment to close spaces using fixed appliances.
7. Insert this Quick Fix wire assembly into the tube of the Side Swives and seat the wire in the brackets on the incisors.

8. Consolidate the incisors with stainless-steel laced ligature to prevent unintended anterior space opening.

9. Slide the arch wires distally along the arch wire to compress the open coil springs until the arch wires are between the first and second primary molars. Then tighten the locks to maintain the spring activation for incisor advancement.

10. Cut the distal end of the arch wire flush to the distal end of the molar tube, not the Side Swive tube. In this manner, about 4–5 mm of arch wire is adjacent to the molar tube and provides sufficient wire for incisor advancement.

(EDITOR’S NOTE: Bowman has a financial interest in the Butterfly System and Quick Fix Kit.)

4 Keys to Orthodontic Success
Unlock your potential with our all new webinar series!

What is a Webinar?
A webinar is a seminar that is transmitted over the Web. Participants will be able to ask Scarlett questions and get answers in real time. Scarlett will be able to conduct polls, and show results as well as ask questions. Participants will receive course materials by e-mail prior to the seminar and will be able to view Scarlett’s PowerPoint slides during the seminar. Webinars offer exceptional convenience and are very cost-effective, eliminating travel expenses all together.

About Scarlett
Scarlett Thomas is an orthodontic practice consultant who has been in the orthodontic field for over 23 years, specializing in case acceptance, team building, office management and marketing. As a speaker and practice consultant, Scarlett has an exceptional talent to inform, motivate and excite!

After implementation of her concepts into your practice, Scarlett invites you to experience not only tremendous growth and increased income but a well organized practice.
Practice makeover update: ongoing transformation

This is the fifth in the Levin Group Total Ortho Success Practice Makeover series

By Jennifer Van Gramins and Cheri Bleyer

“We made great strides this past year, but our journey is still under way,” said Dr. Michelle Gonzalez, winner of the 2010 Levin Group Total Ortho Success” Practice Makeover, The San Rafael, Calif., orthodontist received year-long consulting programs in both orthodontic management and referral marketing.

Gonzalez, the owner and operator of a successful 15-year-old ortho practice in an affluent area, entered the contest because she wanted to take her practice to the next level.

In the practice in the office hadn’t been updated for a number of years, which is typical for many practices. Levin Group recommends redesigning practice systems and processes each three to five years to keep pace with the changes taking place in the office, including the introduction of new technologies, new services, new workflow and new personnel.

In addition, team members weren’t always on the same page, which resulted in miscommunication and unnecessary stress. “It can be easy to focus on the day-to-day and lose sight of the big picture, which was starting to happen in my practice,” said Gonzalez.

“The consulting experience really opened my eyes to my practice’s full potential, and Levin Group helped me develop a roadmap to achieve ultimate success,” she said.

A big part of that roadmap was creating a vision statement, which lays out where Gonzalez wants to take her practice in the next three to five years. She set challenging performance targets for the next three years and sees the practice achieving them with the help of her team and improved systems.

Orthodontist leadership

Leading a team can be extremely challenging due to the time constraints placed on orthodontists. As the practice’s main producer, an orthodontist spends most of her day providing patient care, which leaves little time for coaching and mentoring the team.

In fact, compared to other dental professionals, orthodontists face far greater demands on their time because of the high volume of patients they see. For example, a GP may see on average 15 to 20 patients a day, whereas an orthodontist can easily see double or triple that number.

Handling that kind of patient volume requires incredible focus, which often leaves little time for team building and training. That’s why Levin Group emphasizes the importance of implementing high-performance systems. When a quality team is trained on step-by-step systems, the practice almost runs by itself.

During the last phase of her management consulting program, Gonzalez visited the Levin Advanced Learning Institute in Phoenix for two days of intensive and interactive training on leadership. Along with a group of about a dozen other dental professionals who are also Levin Group clients, she learned topics such as:

• Guiding the team
• Enhancing time management
• Improving communication
• Achieving financial independence
• Managing people
• Achieving a vision

This peer-learning experience spurs insightful comments and feedback based on the participants’ diverse backgrounds and leadership styles. Clinicians compare and contrast what has and hasn’t worked in their practices.

As an orthodontist and solo practice owner, you often work in an insulated environment,” Gonzalez said. “So it was especially helpful to hear how orthodontists from across the country are dealing with challenges and achieving success.”

Two biggest wins

Gonzalez said the new scheduling system and a structured referral marketing program are the two biggest improvements since the makeover began.

“Previously, our schedule wasn’t functioning at an optimal level. There was some confusion at times between the front office and back office staff regarding the schedule. Now everybody is on the same page,” she said.

The practice conducted procedural time studies — a necessary step to creating an accurate schedule. Computers were installed in treatment rooms, allowing the clinical team to add notes to patient records and schedule the next appointment. In addition, processes were put in place to improve communication between administrative and clinical staff.

“When everybody on the team knows what’s going on, then we all can be focused on providing patients and parents the best possible experience,” the orthodontist said.

In the spring, the practice upgraded its referral marketing efforts. Gonzalez brought on a new employee, LeAnn, as a part-time practice coordinator (what Levin Group calls a professional relations coordinator) to consistently communicate with the practice’s referral base and potential referrers. The results have been outstanding: stronger referral relationships, the addition of new referring doctors and increased referrals.

“In the past, I would personally do all office visits, but it wasn’t consistent simply because of my busy schedule,” she said. “Having a dedicated employee just makes more sense, and it’s far more effective.”

Final thoughts

“You can always get better,” Gonzalez said. “And sometimes you need help to get better. That’s probably the biggest lesson I learned during this makeover year.”

The San Rafael orthodontist is looking forward to even more success in 2011 and the years ahead.

“My team and I have learned a lot from our consulting experience, and we are ready to keep building on those accomplishments. Full steam ahead!”

Educate yourself: it's the best way to top the competition

new this year:

Live Demonstrations
Debuting this year, live demonstrations in the Exhibit Hall will showcase the latest advances in digital impression software by 3M, laser EOS, S400, and CEREC, used to acquire digital impressions needed for CAD/CAM fabrication of prosthetics. Come and learn how innovations created digitally can benefit your practice, patient satisfaction and profitability.

This will provide a unique opportunity to compare the systems and learn from expert clinicians while they perform live procedures. This will be an interactive forum and attendees are encouraged to ask questions.

Table Clinics
Ten post-graduate residents in the Advanced Education in General Dentistry program at Joint Base Lewis-McChord JBLM, will present table clinics inside the Exhibit Hall. These clinics, a popular way to learn from peers, will debut this year in the Exhibit Hall. Subjects will include cavity detection, irrigation, whitening, and more.

Expanded Tracks
Creating interesting, dynamic tracks for your team members is important to us. We make it easy for them by detailing lectures best suited to their position — and we make it easy for you to choose the lectures and workshops you think they should attend.

Align Technology, Cadent announce a joint development agreement

Companies to develop 3-D scanner-based applications for Invisalign treatment

Align Technology and Cadent announced an agreement to jointly develop software applications that will run on Cadent SS iTero™ and iOC™ scanners for use in Invisalign treatment. The new applications will optimize case assessment and planning for Invisalign treatment and bring digital tools chairside for Invisalign providers who use Cadent scanners.

“‘The joint development agreement with Cadent is in line with our long term strategic initiatives of improving the Invisalign customer experience through innovation,” said Thomas M. Prescott, Align president and CEO.

“Our partnership with Cadent allows us to leverage our own and other innovative technology to bring digital diagnosis and treatment tools conveniently chairside in customers’ practices.”

“Cadent’s powder-free scanning technology is fundamental for meeting the precision demanded by Align’s standards,” said Timothy Mack, Cadent president and CEO. “We are honored to develop new Invisalign applications, which leverage our combined technologies and create value for our mutual customers and their patients. Integration with Invisalign has been one of the most widely requested enhancements by both general practitioners who use the iTero system and orthodontists who are using the iOC system.”

During the past few years, Align has worked with several manufacturers of intra-oral scanning (IOS) systems to evaluate interoperability of these systems for future use with Invisalign treatment. Rigorous standards for scan quality and accuracy have been defined by Align to ensure a specific scanning technology can successfully replace the physical impressions currently used in an Invisalign case submission.

As part of that program, Align is in final beta tests with Cadent to validate its systems for use with Invisalign and expects to announce interoperability in the second quarter of 2011.

Under the terms of the agreement, Align will fund several million dollars for Cadent software development during the next few quarters in order to accelerate the availability of these chairside applications. Align will own all rights to the developed applications and technology.

About Align Technology

Align Technology designs, manufactures and markets Invisalign, a proprietary method for treating malocclusion. Invisalign corrects malocclusion using a series of clear, nearly invisible, removable appliances that gently move teeth to a desired final position. Because it does not rely on the use of metal or ceramic brackets and wires, Invisalign significantly reduces theesthetic and other limitations associated with braces. For more information, visit www.aligntech.com.

About Cadent

Cadent is the leading provider of 3-D digital CAD/CAM solutions for the orthodontic and dental industries. The company services thousands of cases per day for a rapidly expanding customer base. Cadent’s offerings, including Cadent iTero™, iOC™ powered by iTero™, OrthoCAD™, iTero™ and iQ™, improve the efficiency and effectiveness of orthodontic and dental treatments while increasing revenue of dental providers. For more information, visit www.cadentinca.com.

DENTSPLY introduces sensitivity products

**NUPRO Sensodyne Prophylaxis Paste and Sensodyne NUPRO Professional Toothpaste both powered by NovaMin**

DENTSPLY International, one of the largest professional dental products companies in the world and maker of NUPRO®, the top brand of prophylaxis paste used by dentists and hygienists, launched two new co-branded sensitivity products at the Chicago Dental Society’s Midwinter Meeting. The pastes are the first in a system designed for continuous care from the dental office to the home.

DENTSPLY’s NUPRO Sensodyne® Prophylaxis Paste is the first prophylaxis paste with patented NovaMin® technology and is the only prophylaxis paste that provides both stain removal and immediate relief of sensitivity. NovaMin, known chemically as calcium sodium phosphosilicate, is clinically proven to immediately relieve dentin sensitivity by occluding dentin tubules.

To use at home, Sensodyne NUPRO Professional Toothpaste, dispensed by dentists, has NovaMin in a high-fluoride toothpaste that remineralizes teeth, prevents caries and relieves sensitivity. Both products are dye- and gluten free.

Some 82 percent of the U.S. population experiences tooth sensitivity at some point in their lifetime. One-third of dental patients experience sensitivity when visiting the office, yet only one-third of those are treated for it.

NovaMin relieves sensitivity while amplifying the natural protective and repair mechanisms of saliva. NovaMin reacts upon contact with saliva, depositing bioavailable calcium and phosphorous ions onto the unprotected areas of the tooth. The ions form hydroxyapatite-like crystals that block the microscopic dentin tubules that lead to nerve endings. Tubule occlusion prevents fluid in the tubules from further exciting the dental nerve endings and causing pain.

Dental sensitivity may result from chemical erosion from acidic beverages such as sodas and sports drinks, including those that are sugar free; overly aggressive and continuous tooth whitening; orthodontic treatments that may move teeth too quickly; root exposure and recession; abrasion from toothbrushes or certain types of toothpaste; bacterial demineralization from sugar and plaque; intrinsic erosion from gastric reflux and eating disorders; bruxism; enamel hypoplasia; abfraction (occlusal forces); xerostomia (reduced saliva flow); receding gums and exposed dentin occurring in the natural process of aging; and periodontal disease and periodontal therapy.

NUPRO Sensodyne Prophylaxis Paste is available in polish and stain-removal grits. Spearmint, peppermint, orange and citrus mint flavors come packaged in convenient, single-use cups, priced at 35 cents per use. Orange and spearmint flavors are also available in 12-ounce jars in fluoride and non-fluoride formulation, polish and stain-removal grits, priced at $45.75 per jar.

The NUPRO Sensodyne comprehensive treatment regimen includes both desensitizing prophyl paste and a high-fluoride toothpaste for remineralization and caries protection.

For professional care that lasts beyond the dental appointment, dentists can dispense Sensodyne NUPRO Professional Toothpaste with NovaMin, a high-sodium fluoride (5000 ppm fluoride ion) mint flavor toothpaste that prevents caries, remineralizes teeth, is dye- and gluten-free and is available in 1.4-ounce tubes, priced at $6.70 per tube to the clinician.

Myofunctional Research Co. (MRC) has been developing innovative intra-oral appliances to treat the causes of malocclusion and TMJ disorder since 1989.

MRC developed these concepts of treating malocclusion into a range of appliance systems suitable for all ages of growing children. Although a significant number of clinicians around the world currently use these systems, many do not realize that MRC has developed more than just orthodontic appliances.

IDS 2009 marked MRC’s launch of MRC Clinics™, a concept which provided the industry with a new way of treating myofunctional habits in growing children for better dental alignment and facial development. This concept also offered a profitable and more cost-effective solution to the worldwide problems orthodontists faced.

Nearly every child has some form of malocclusion, and traditional treatment methods of fixed braces have shown large limitations and, arguably, failure in the long term.

Our fundamental philosophy at MRC differs from other international companies as we do not only develop orthodontic appliances, but we also put a strong focus on advancing knowledge through developing educational materials on the importance of correcting myofunctional habits in children as early as possible.

MRC’s main goal is not just straightening teeth without braces; it is to make a lifelong positive impact on the development and health of children.

MRC has been able to achieve better health and development for patients by creating effective education to directly educate clinicians, parents and patients. This dedication to delivering quality educational materials is a crucial part of our role as an active educational company.

The key to MRC’s approach is to educate at every level: from the clinician right through to the growing child. Providing proper education can empower clinicians to break out of the old, outdated concepts of orthodontics, leading many to better and more profitable methods of delivering proper pediatric care for more children.

IDS 2011 will allow MRC to demonstrate practical and cost-effective means of delivering advanced myofunctional correction for every child, along with showcasing MRC’s latest world-leading appliances.

About the author

Dr. Chris Farrell graduated from Sydney University in 1971 with a comprehensive knowledge of traditional orthodontics using the BEGG technique. Through clinical experience, he took an interest in TMJ/TMD disorder and, after further research, Farrell discovered that the etiology of malocclusion and TMJ disorder was myofunctional, which contradicted the current views of his profession. Farrell founded Myofunctional Research Co. in 1989, and the company has become the leading designer of intra-oral appliances for orthodontics, TMJ and sports mouth guards.

Providing comprehensive educational materials in combination with a range of effective orthodontic appliances could produce a healthier and brighter future for all.

Orthodontists who use topsOrtho™ practice management and imaging software can now access a practice’s essential patient information via their iPhones.

The new topsEcho app for the iPhone and iPod touch provides real-time patient information, high-resolution images, X-rays, appointments, ledgers, schedule, referring doctor information, treatment notes and more.

topsEcho needs no uploading, syncing or linking. Just a tap on the app instantly connects to real-time information with from practically anywhere.

“Top this app is as easy, secure and fast as anything I’ve seen — and I have more than 200 apps on my own iPhone,” said tops CEO Dr. Mark Sanchez.

“It took us a long time in development to get it just right because we wanted our customers to have a fantastic user experience with topsEcho. I believe this product delivers on that vision.”

topsEcho is a companion to the topsOrtho orthodontic practice management and imaging system. Using topsEcho with topsOrtho requires version 4.0 or newer, a topsOrtho support contract and a current topsEcho service contract.

For more information about topsEcho, contact tops software sales at (888) 770-2488 or sales@topsOrtho.com.

OrthoVOICE introduces VOICE of Excellence Lecture for 2011 meeting

Meeting to take place Oct. 20–22 at Planet Hollywood Resort & Casino in Las Vegas

If you missed the inaugural OrthoVOICE meeting this past September, then according to organizers, you missed a powerful, two-day, thought-provoking, practice-building, collaboration session among clinicians, team members and vendors.

The OrthoVOICE meeting is designed to showcase the clinical and entrepreneurial energy taking place in today’s progressive orthodontic practice. It’s a platform for forward-thinking experts within the industry to discover, reinvent and grow.

As OrthoVOICE builds on the success of the 2010 meeting, organizers look forward to Oct. 20–22 when they will host the second meeting. OrthoVOICE is set to return to the famous Planet Hollywood Resort & Casino in the heart of the Las Vegas strip.

Many new events are being added to the 2011 schedule, including the VOICE of Excellence Lecture. This lecture will be given at the opening general session at 8 a.m. on Friday and is designed to highlight a speaker who has demonstrated continued excellence in his or her personal orthodontic career and made significant contributions to the orthodontic profession as a whole.

The first lecture in this series will feature Dr. William R. Proffit. Proffit is the Kenan Professor and former chairman at the University of North Carolina Orthodontic Department. According to organizers, Proffit exemplifies excellence in orthodontics and has made many contributions to the profession globally.

With a focus toward non-clinical matters, OrthoVOICE offers a plethora of topics for the orthodontist and the team member and is offering a stacked lineup of speakers. You can view the speaker list and schedule at the OrthoVOICE website, www.orthovoice.com.

Returning to the OrthoVOICE schedule by popular demand is the "Dinner with Strangers" dinners. This unique event offered by OrthoVOICE is intended to facilitate collaboration and idea sharing among the attendees outside of the traditional meeting atmosphere.

Organizers will make reservations at a range of restaurants around Vegas for groups of 10 to 12 people. When attendees arrive on site, they will be able to sign up on a first-come basis for the different restaurant choices. OrthoVOICE will also arrange for all bills to be split individually so there are no awkward moments when you go to pay.

"Often I attend a meeting and don’t know anyone but want to go to a nice restaurant. Dinner with Strangers offers me that opportunity," said Dr. Bart Benson, who attended the 2010 meeting. "I had such a great time with my group the first night, I actually missed the second night’s dinner to go to a show with the doctors I met the first night!"

“One reason we returned to Planet Hollywood is because many attendees and vendors loved the easy access to the exhibit hall and lecture rooms from the hotel rooms,” said Davin Bickford, one of the events organizers. “They did not have to walk through the casino at any time unless they wanted to and that was a major plus.

“We received great feedback from the 2010 meeting and have carefully reviewed all comments from attendees and vendors to guide any decisions to create an even better program for 2011.”
